## Pr APO-LEVOFLOXACIN

(levofloxacin)

250 mg, 500 mg and 750 mg Tablets Apotex Standard

Antibacterial Agent

APOTEX INC. 150 Signet Drive Toronto, Ontario M9L 1T9

Control number: 215173

DATE OF REVISION: June 20, 2018

#### Pr APO-LEVOFLOXACIN

(levofloxacin) 250 mg, 500 mg and 750 mg Tablets

Antibacterial Agent

#### PART I: HEALTH PROFESSIONAL INFORMATION

#### SUMMARY PRODUCT INFORMATION

Route of Administration	Dosage Form / Strength	All Nonmedicinal Ingredients
Oral	Tablet / 250 mg, 500 mg and 750 mg	croscarmellose sodium, magnesium stearate, colloidal silicon dioxide, methylcellulose, stearic acid, hydroxypropyl methylcellulose, hydroxypropyl cellulose, polyethylene glycol, titanium dioxide, red ferric oxide (250 mg and 500mg), yellow ferric oxide (500 mg)

#### INDICATIONS AND CLINICAL USE

APO-LEVOFLOXACIN tablets are indicated for the treatment of adults with bacterial infections caused by susceptible strains of the designated microorganisms in the infections listed below.

#### **Upper Respiratory Tract**

Acute sinusitis (mild to moderate) due to *Streptococcus pneumoniae*, *Haemophilus influenzae*, or *Moraxella* (*Branhamella*) catarrhalis.

"Restrict the use of APO-LEVOFLOXACIN to settings where no other treatment options exist, and the clinical presentation meets the diagnostic criteria for acute bacterial sinusitis."

#### **Lower Respiratory Tract**

Acute bacterial exacerbations of chronic bronchitis (mild to moderate) due to *Staphylococcus* aureus, *Streptococcus* pneumoniae, *Haemophilus* influenzae, *Haemophilus* parainfluenzae, or *Moraxella* (*Branhamella*) catarrhalis.

Community-acquired pneumonia (mild, moderate and severe infections) due to *Staphylococcus* aureus, *Streptococcus* pneumoniae (including penicillin-resistant strains), *Haemophilus* influenzae, *Haemophilus* parainfluenzae, *Klebsiella* pneumoniae, *Moraxella* (*Branhamella*) catarrhalis, *Chlamydia* pneumoniae, *Legionella* pneumophila, or *Mycoplasma* pneumoniae (see DOSAGE AND ADMINISTRATION, and *Product Monograph Part II*: CLINICAL TRIALS).

<sup>&</sup>lt;sup>1</sup> Canadian clinical practice guidelines for acute and chronic rhinosinusitis. Desrosiers et al. *Allergy*, *Asthma and Clinical Immunology*, 2011, 7:2

Nosocomial pneumonia due to methicillin-susceptible *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Serratia marcescens*, *Escherichia coli*, *Klebsiella pneumoniae*, *Haemophilus influenzae* or *Streptococcus pneumoniae*. Adjunctive therapy should be used as clinically indicated. Where *Pseudomonas aeruginosa* is a documented or presumptive pathogen, combination therapy with an anti-pseudomonal β-lactam is recommended.

APO-LEVOFLOXACIN is not indicated for acute bronchitis.

APO-LEVOFLOXACIN should not be prescribed to patients with acute bacterial exacerbations of simple/uncomplicated chronic obstructive pulmonary disease (ie. patients who have chronic obstructive pulmonary disease without underlying risk factors)<sup>2</sup>

#### **Skin and Skin Structure**

Uncomplicated skin and skin structure infections (mild to moderate) due to *Staphylococcus aureus* or *Streptococcus pyogenes*.

Complicated skin and skin structure infections (mild to moderate), excluding burns, due to *Enterococcus faecalis*, methicillin-sensitive *Staphylococcus aureus*, *Streptococcus pyogenes*, *Proteus mirabilis*, or *Streptococcus agalactiae*.

#### **Urinary Tract**

Complicated urinary tract infections (mild to moderate) due to *Enterococcus (Streptococcus)* faecalis, Enterobacter cloacae, Escherichia coli, Klebsiella pneumoniae, Proteus mirabilis, or Pseudomonas aeruginosa (see DOSAGE AND ADMINISTRATION and Product Monograph Part II: CLINICAL TRIALS).

Uncomplicated urinary tract infections (mild to moderate) due to *Escherichia coli, Klebsiella pneumoniae* or *Staphylococcus saprophyticus*.

Acute pyelonephritis (mild to moderate) caused by *Escherichia coli* (see DOSAGE AND ADMINISTRATION and *Product Monograph Part II*: CLINICAL TRIALS). Chronic bacterial prostatitis due to *Escherichia coli*, *Enterococcus faecalis*, or *Staphylococcus epidermidis*.

Appropriate culture and susceptibility tests should be performed before treatment in order to isolate and identify the organisms causing the infection, and to determine their susceptibility to levofloxacin. Therapy with levofloxacin may be initiated before the results of these tests are known; once results become available, appropriate therapy should be continued.

In cases of uncomplicated acute bacterial cystitis, limit the use of APO-LEVOFLOXACIN to circumstances where no other treatment options are available. A urine culture should be obtained prior to treatment to ensure levofloxacin susceptibility.

As with other drugs in this class, some strains of *Pseudomonas aeruginosa* may develop

<sup>&</sup>lt;sup>2</sup> Canadian Thoracic Society recommendations for management of chronic obstructive pulmonary disease – 2008 update – highlights for primary care. O'Donnell et al. Can Respir J 2008; 15 (Suppl A): 1A-8A.

resistance fairly rapidly during treatment with levofloxacin. Culture and susceptibility testing performed periodically during therapy, will reveal not only the therapeutic effect of the antimicrobial agent, but also the possible emergence of bacterial resistance.

To reduce the development of drug-resistant bacteria and maintain the effectiveness of APO-LEVOFLOXACIN and other antibacterial drugs, APO-LEVOFLOXACIN should be used only to treat infections that are proven or strongly suspected to be caused by susceptible bacteria. When culture and susceptibility information are available, they should be considered in selecting or modifying antibacterial therapy. In the absence of such data, local epidemiology and susceptibility patterns may contribute to the empiric selection of therapy.

#### Geriatric ( $\geq$ 65 years of age):

Drug absorption appears to be unaffected by age. Dose adjustment based on age alone is not necessary (see WARNINGS AND PRECAUTIONS, <u>Special Populations</u> and ACTION AND CLINICAL PHARMACOLOGY, Special Populations and Conditions).

#### Pediatric Use (<18 years of age):

Safety and effectiveness in children under 18 years of age have not been established (see **WARNINGS AND PRECAUTIONS**, <u>Special Populations</u>).

#### CONTRAINDICATIONS

APO-LEVOFLOXACIN tablets are contraindicated in persons with a history of hypersensitivity to levofloxacin, quinolone antimicrobial agents or to any components of this product. For a complete listing, see the **DOSAGE FORMS, COMPOSITION AND PACKAGING** section of the Product Monograph.

Levofloxacin is also contraindicated in persons with a history of tendinitis or tendon rupture associated with the use of any member of the quinolone group of antimicrobial agents.

#### WARNINGS AND PRECAUTIONS

#### **Serious Warnings and Precautions**

- Levofloxacin has been shown to prolong the QT interval of the electrocardiogram in some patients (see **WARNINGS AND PRECAUTIONS**, <u>Cardiovascular</u>).
- Serious hypersensitivity and/or anaphylactic reactions have been reported in patients receiving quinolone therapy, including levofloxacin (see WARNINGS AND PRECAUTIONS, <u>Immune</u>).
- Seizures may occur with quinolone therapy. APO-LEVOFLOXACIN should be used with caution in patients with known or suspected CNS disorders which may predispose to seizures or lower the seizure threshold (see WARNINGS AND PRECAUTIONS, Neurologic).
- Fluoroquinolones, including levofloxacin, may exacerbate muscle weakness in persons with myasthenia gravis. Avoid levofloxacin in patients with a known history of myasthenia gravis (see WARNINGS AND PRECAUTIONS, Musculoskeletal).
- Fluoroquinolones, including APO-LEVOFLOXACIN, have been associated with

disabling and potentially persistent adverse reactions which to date include, but are not limited to: tendonitis, tendon rupture, peripheral neuropathy and neuropsychiatric effects.

#### General

The administration of levofloxacin increased the incidence and severity of osteochondrosis in immature rats and dogs. Other quinolones also produce similar erosions in the weight-bearing joints and other signs of arthropathy in immature animals of various species. Consequently, levofloxacin should not be used in pre-pubertal patients (see *Product Monograph Part II*: TOXICOLOGY).

Although levofloxacin is soluble, adequate hydration of patients receiving levofloxacin should be maintained to prevent the formation of a highly concentrated urine. Crystalluria has been observed rarely in patients receiving other quinolones, when associated with high doses and an alkaline urine. Although crystalluria was not observed in clinical trials with levofloxacin, patients are encouraged to remain adequately hydrated.

As with any antimicrobial drug, periodic assessment of organ system functions, including renal, hepatic, and hematopoietic, is advisable during prolonged therapy (see ADVERSE REACTIONS).

Use of levofloxacin with other drugs may lead to drug-drug interactions (see **DRUG** INTERACTIONS, Drug-Drug Interactions).

#### **Sexually Transmitted Diseases**

Levofloxacin is not indicated for the treatment of syphilis or gonorrhea. Levofloxacin is not effective in the treatment of syphilis. Antimicrobial agents used in high doses for short periods of time to treat gonorrhea may mask or delay the symptoms of incubating syphilis. All patients with gonorrhea should have a serologic test for syphilis at the time of diagnosis. Patients treated with antimicrobial agents with limited or no activity against *Treponema pallidum* should have a follow-up serologic test for syphilis after 3 months.

#### Cardiovascular

#### **QT Prolongation**

Some quinolones, including levofloxacin, have been associated with prolongation of the QT interval on the electrocardiogram and infrequent cases of arrhythmia. During post-marketing surveillance, very rare cases of torsades de pointes have been reported in patients taking levofloxacin. These reports generally involved patients with concurrent medical conditions or concomitant medications that may have been contributory. The risk of arrhythmias may be reduced by avoiding concurrent use with other drugs that prolong the QT interval including macrolide antibiotics, antipsychotics, tricyclic antidepressants, Class IA (e.g., quinidine, procainamide) or Class III (e.g., amiodarone, sotalol) antiarrhythmic agents, and cisapride. In addition, use of levofloxacin in the presence of risk factors for torsades de pointes such as hypokalemia, significant bradycardia, cardiomyopathy, patients with myocardial ischemia, and patients with congenital prolongation of the QT interval should be avoided (see *Product* Monograph Part II: DETAILED PHARMACOLOGY, Human Pharmacology, Studies

#### Measuring Effects on QT and Corrected QT (QTc) Intervals).

#### **Endocrine and Metabolism**

#### **Disturbances of Blood Glucose**

Disturbances of blood glucose, including symptomatic hyper- and hypoglycemia, have been reported with the use of quinolones, including levofloxacin. In patients treated with levofloxacin, some of these cases were serious. Blood glucose disturbances were usually in diabetic patients receiving concomitant treatment with an oral hypoglycemic agent (e.g., glyburide/glibenclamide) and/or with insulin. In these patients, careful monitoring of blood glucose is recommended. If a hypoglycemic reaction occurs in a patient being treated with levofloxacin, discontinue levofloxacin immediately and initiate appropriate therapy. Serious hypoglycemia and hyperglycemia have also occurred in patients without a history of diabetes (see ADVERSE REACTIONS and DRUG INTERACTIONS, <u>Drug-Drug Interactions</u>, Antidiabetic Agents).

Hypoglycemic coma has been observed in diabetic patients with the use of levofloxacin. Fatal outcomes have been reported. All cases of hypoglycemic coma had multiple confounding factors; a temporal relationship with the use of levofloxacin was identified (onset of altered consciousness occurred within 3 days in most cases). Caution should be exercised when using levofloxacin in diabetic patients taking concomitant treatment with an oral hypoglycemic agent and/or insulin, especially those who are elderly or who have renal impairment (see WARNINGS AND PRECAUTIONS, Renal and DRUG INTERACTIONS, <u>Drug-Drug Interactions</u>, Antidiabetic Agents).

#### **Gastrointestinal**

#### Clostridium difficile-associated disease

Clostridium difficile-associated disease (CDAD) has been reported with use of many antibacterial agents, including levofloxacin. CDAD may range in severity from mild diarrhea to fatal colitis. It is important to consider this diagnosis in patients who present with diarrhea or symptoms of colitis, pseudomembranous colitis, toxic megacolon, or perforation of the colon subsequent to the administration of any antibacterial agent. CDAD has been reported to occur over 2 months after the administration of antibacterial agents.

Treatment with antibacterial agents may alter the normal flora of the colon and may permit overgrowth of *Clostridium difficile*. *C. difficile* produces toxins A and B, which contribute to the development of CDAD. CDAD may cause significant morbidity and mortality. CDAD can be refractory to antimicrobial therapy.

If the diagnosis of CDAD is suspected or confirmed, appropriate therapeutic measures should be initiated. Mild cases of CDAD usually respond to discontinuation of antibacterial agents not directed against *Clostridium difficile*. In moderate to severe cases, consideration should be given to management with fluids and electrolytes, protein supplementation, and treatment with an antibacterial agent clinically effective against *Clostridium difficile*. Surgical evaluation should be instituted as clinically indicated since surgical intervention may be required in certain severe cases (see **ADVERSE REACTIONS**).

#### Hepatic

Very rare post-marketing reports of severe hepatotoxicity (including acute hepatitis and fatal events) have been received for patients treated with levofloxacin. No evidence of serious drug-associated hepatotoxicity was detected in clinical trials of over 7,000 patients. Severe hepatotoxicity generally occurred within 14 days of initiation of therapy and most cases occurred within 6 days. Most cases of severe hepatotoxicity were not associated with hypersensitivity. The majority of fatal hepatotoxicity reports occurred in patients 65 years of age or older and most were not associated with hypersensitivity. Levofloxacin should be discontinued immediately if the patient develops signs and symptoms of hepatitis (see **ADVERSE REACTIONS**, <u>Post-Market Adverse Drug Reactions</u>).

#### **Immune**

#### Hypersensitivity

Serious and occasionally fatal hypersensitivity and/or anaphylactic reactions have been reported in patients receiving therapy with quinolones, including levofloxacin. These reactions often occur following the first dose. Some reactions have been accompanied by cardiovascular collapse, hypotension/shock, seizure, loss of consciousness, tingling, angioedema (including tongue, laryngeal, throat or facial edema/swelling), airway obstruction (including bronchospasm, shortness of breath, and acute respiratory distress), dyspnea, urticaria, itching, and other serious skin reactions. Levofloxacin should be discontinued immediately at the first appearance of a skin rash or any other sign of hypersensitivity. Serious acute hypersensitivity reactions may require treatment with epinephrine and other resuscitative measures, including oxygen, intravenous fluids, antihistamines, corticosteroids, pressor amines and airway management, as clinically indicated (see **ADVERSE REACTIONS**).

Serious and sometimes fatal events, some due to hypersensitivity and some due to uncertain etiology, have rarely been reported in patients receiving therapy with quinolones, including levofloxacin. These events may be severe and generally occur following the administration of multiple doses. Clinical manifestations may include one or more of the following: fever; rash or severe dermatologic reactions (e.g., toxic epidermal necrolysis, Stevens-Johnson syndrome); vasculitis; arthralgia; myalgia; serum sickness; allergic pneumonitis; interstitial nephritis; acute renal insufficiency or failure; hepatitis, including acute hepatitis; jaundice; acute hepatic necrosis or failure; anemia, including hemolytic and aplastic; thrombocytopenia, including thrombotic thrombocytopenic purpura; leukopenia; agranulocytosis; pancytopenia; and/or other hematologic abnormalities. The administration of levofloxacin should be discontinued immediately, at the first appearance of a skin rash or any other sign of hypersensitivity, and supportive measures instituted (see **ADVERSE REACTIONS**).

#### Musculoskeletal

#### **Tendinitis**

Rupture of the shoulder, hand and Achilles tendons that required surgical repair or resulted in prolonged disability have been reported in patients receiving quinolones, including levofloxacin. Levofloxacin should be discontinued if the patient experiences pain, inflammation or rupture of a tendon. Patients should rest and refrain from exercise until the diagnosis of tendinitis or tendon rupture has been confidently excluded. The risk of developing fluoroquinolone-associated tendinitis and tendon rupture is further increased in older patients usually over 60 years of age, in patients taking corticosteroid drugs, and in patients with kidney, heart or lung transplants. Factors, in addition to

age and corticosteroid use, that may independently increase the risk of tendon rupture include strenuous physical activity, renal failure, and previous tendon disorders such as rheumatoid arthritis. Tendinitis and tendon rupture have also occurred in patients taking fluoroquinolones who do not have the above risk factors. Tendon rupture can occur during or after completion of therapy; cases occurring up to several months after completion of therapy have been reported. Levofloxacin should be discontinued if the patient experiences pain, swelling, inflammation or rupture of a tendon. Patients should be advised to rest at the first sign of tendinitis or tendon rupture, and to contact their healthcare provider regarding changing to a non-quinolone antimicrobial drug (see **ADVERSE REACTIONS**).

Levofloxacin should not be used in patients with a history of tendon disease/disorder related to previous quinolone treatment (see **CONTRAINDICATIONS**).

#### **Myasthenia Gravis**

Fluoroquinolones have neuromuscular blocking activity and may exacerbate muscle weakness in persons with myasthenia gravis. Post-marketing serious adverse events, including deaths and requirement for ventilatory support, have been associated with fluoroquinolone use (including levofloxacin) in persons with myasthenia gravis. Avoid levofloxacin in patients with a known history of myasthenia gravis (see **ADVERSE REACTIONS**, <u>Post-Market Adverse Drug Reactions</u>).

#### **Neurologic**

#### **CNS and Psychiatric Effects**

Convulsions, toxic psychoses and increased intracranial pressure (including pseudotumor cerebri) have been reported in patients receiving quinolones, including levofloxacin. Quinolones including levofloxacin, may also cause central nervous system stimulation which may lead to tremors, restlessness, anxiety, lightheadedness, dizziness, confusion and hallucinations, paranoia, depression, nightmares, insomnia and, rarely, suicidal thoughts or acts. These reactions may occur following the first dose. If these reactions occur in patients receiving levofloxacin, the drug should be discontinued and appropriate measures instituted. As with all quinolones, levofloxacin should be used with caution in patients with a known or suspected CNS disorder that may predispose to seizures or lower the seizure threshold (e.g., severe cerebral arteriosclerosis, epilepsy), or in the presence of other risk factors that may predispose to seizures or lower the seizure threshold (e.g., alcohol abuse, certain drug therapies such as NSAIDs and theophylline, renal dysfunction). Levofloxacin should be used with caution in patients with unstable psychiatric illness (see **DRUG INTERACTIONS** and **ADVERSE REACTIONS**).

#### **Peripheral Neuropathy**

Rare cases of sensory or sensorimotor axonal polyneuropathy affecting small and/or large axons resulting in paresthesias, hypoesthesias, dysesthesias and weakness have been reported in patients receiving quinolones, including levofloxacin. Symptoms may occur soon after initiation of treatment and may be irreversible. Levofloxacin should be discontinued immediately if the patient experiences symptoms of neuropathy including pain, burning, tingling, numbness, and/or weakness or other alterations of sensation including light touch, pain, temperature, position sense, and vibratory sensation in order to prevent the development of an irreversible condition.

#### **Ophthalmologic**

#### **Vision Disorders**

Consult an eye specialist if vision disorder occurs in association with the use of APO-Levofloxacin.

#### Renal

Safety and efficacy of levofloxacin in patients with impaired renal function (creatinine clearance  $\leq 80 \text{ mL/min}$ ) have not been studied. Since levofloxacin is known to be substantially excreted by the kidney, the risk of toxic reactions to this drug may be greater in patients with impaired renal function. The potential effects of levofloxacin associated with possible increased serum/tissue levels in renal impaired patients, such as effect on QTc interval, have not been studied. Adjustment of the dosage regimen may be necessary to avoid the accumulation of levofloxacin due to decreased clearance. Careful clinical observation and appropriate laboratory studies should be performed prior to and during therapy, since elimination of levofloxacin may be reduced. Because elderly patients are more likely to have decreased renal function, care should be taken in dose selection and it may be useful to monitor renal function. Administer levofloxacin with caution in the presence of renal insufficiency (see **DOSAGE AND ADMINISTRATION, Recommended Dose and Dosage Adjustment**, Patients with Impaired Renal Function and *Product Monograph Part II*: **DETAILED PHARMACOLOGY**, <u>Factors Influencing the Pharmacokinetics</u>, Special Populations, Renal Insufficiency).

#### **Skin**

#### **Phototoxicity**

Moderate to severe phototoxicity reactions have been observed in patients exposed to direct sunlight or ultraviolet (UV) light while receiving drugs in this class. Excessive exposure to sunlight or UV light should be avoided. However, in clinical trials with levofloxacin, phototoxicity has been observed in less than 0.1% of patients. Therapy should be discontinued if phototoxicity (e.g., skin eruption) occurs.

# Susceptibility/Resistance **Development of Drug Resistant Bacteria**

Prescribing APO-LEVOFLOXACIN in the absence of a proven or strongly suspected bacterial infection is unlikely to provide benefit to the patient and risks the development of drug-resistant bacteria.

#### **Special Populations**

The safety and efficacy of levofloxacin tablets in children, adolescents (under the age of 18 years), pregnant women and nursing mothers have not been established.

**Pregnant Women:** There are no adequate and well-controlled studies in pregnant women. Levofloxacin should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus (see *Product Monograph Part II*: TOXICOLOGY).

Nursing Women: Levofloxacin has not been measured in human milk. Based upon data from

ofloxacin, it can be presumed that levofloxacin can be excreted in human milk. Because of the potential for serious adverse reactions from levofloxacin in nursing infants, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother (see *Product Monograph Part II*: TOXICOLOGY).

**Pediatrics (<18 years of age):** Levofloxacin is not indicated for the treatment of patients younger than 18 years of age. Quinolones, including levofloxacin, cause arthropathy in juvenile animals of several species (see *Product Monograph Part II*: TOXICOLOGY). The incidence of protocol-defined musculoskeletal disorders in a prospective long-term surveillance study was higher in children treated for approximately 10 days with levofloxacin than in children treated with non-fluoroquinolone antibiotics for approximately 10 days (see **ADVERSE REACTIONS**).

Geriatrics (≥65 years of age): The pharmacokinetic properties of levofloxacin in younger adults and elderly adults do not differ significantly when creatinine clearance is taken into consideration. However, since the drug is known to be substantially excreted by the kidney, the risk of toxic reactions to this drug may be greater in patients with impaired renal function. Because elderly patients are more likely to have decreased renal function, care should be taken in dose selection. It may also be useful to monitor renal function.

Elderly patients may be more susceptible to drug-associated effects on the QT interval (see **WARNINGS AND PRECAUTIONS, <u>Cardiovascular</u>**).

Geriatric patients are at increased risk for developing severe tendon disorders including tendon rupture when being treated with a fluoroquinolone such as levofloxacin. This risk is further increased in patients receiving concomitant corticosteroid therapy (see WARNINGS AND PRECAUTIONS, <u>Musculoskeletal</u>).

Severe and sometimes fatal cases of hepatotoxicity have been reported post-marketing in association with levofloxacin. The majority of fatal hepatotoxicity reports occurred in patients 65 years of age or older and most were not associated with hypersensitivity (see **WARNINGS AND PRECAUTIONS**, **Hepatic**).

#### **Effects on Ability to Drive and Use Machines**

Neurologic adverse effects such as dizziness and lightheadedness may occur. Therefore, patients should know how they react to levofloxacin before operating an automobile or machinery or engaging in other activities requiring mental alertness and coordination.

#### ADVERSE REACTIONS

#### Adverse Drug Reaction Overview

In North American Phase III clinical trials involving 7537 subjects, the incidence of treatment-emergent adverse events in patients treated with levofloxacin tablets and injection was comparable to comparators. The majority of adverse events were considered to be mild to moderate, with 5.6% of patients considered to have severe adverse events. Among patients receiving multiple-dose therapy, 4.2% discontinued therapy with levofloxacin due to adverse

experiences. The incidence of drug-related adverse reactions was 6.7%.

In clinical trials, the most frequently reported adverse drug reactions occurring in > 3% of the study population were nausea, headache, diarrhea, insomnia, dizziness and constipation. Serious and otherwise important adverse drug reactions are discussed in greater detail in other sections (see WARNINGS AND PRECAUTIONS).

#### **Clinical Trial Adverse Drug Reactions**

Because clinical trials are conducted under very specific conditions, the adverse reaction rates observed in the clinical trials may not reflect the rates observed in practice and should not be compared to the rates in the clinical trials of another drug. Adverse drug reaction information from clinical trials is useful for identifying drug-related adverse events and for approximating rates.

The data described below reflect exposure to levofloxacin in 7537 patients in 29 pooled Phase III clinical trials. The population studied had a mean age of 49.6 years (74.2% of the population was < 65 years), 50.1% were male, 71.0% were Caucasian, 18.8% were Black. Patients were treated with levofloxacin for a wide variety of infectious diseases (see **INDICATIONS AND CLINICAL USE**). Treatment duration was usually 3 to 14 days, the mean number of days on therapy was 9.6 days and the mean number of doses was 10.2. Patients received levofloxacin doses of 750 mg once daily, 250 mg once daily, or 500 mg once or twice daily. The overall incidence, type and distribution of adverse reactions were similar in patients receiving levofloxacin doses of 750 mg once daily, 250 mg once daily, and 500 mg once or twice daily.

Adverse reactions (characterized as likely related to drug-therapy) occurring in  $\geq 1\%$  of levofloxacin-treated patients are shown in Table 1.1 below.

Table 1.1: Common (≥1%) Adverse Reactions Reported in Clinical Trials with Levofloxacin

System/Organ Class	Adverse Reaction	% (N=7537)
Infections and Infestations	moniliasis	1
Psychiatric Disorders	insomnia	4 <sup>a</sup>
Nervous System Disorders	headache	6
	dizziness	3
Respiratory, Thoracic and	dyspnea	1
Mediastinal Disorders

$^{a}N = 7274$		
$^{b}N = 3758 \text{ (women)}$		

<u>Less Common Clinical Trial Adverse Drug Reactions (<1%)</u>
Less common adverse reactions occurring in 0.1 to <1% of levofloxacin-treated patients are shown in Table 1.2 below.

Table 1.2: Less Common (0.1 to <1%) Adverse Reactions Reported in Clinical **Trials with Levofloxacin** 

System/Organ Class	Adverse Reaction
Blood and Lymphatic System Disorders	anemia, thrombocytopenia, granulocytopenia
Cardiac Disorders	cardiac arrest, palpitation, ventricular tachycardia, ventricular arrhythmia
Gastrointestinal Disorders	gastritis, stomatitis, pancreatitis, esophagitis, gastroenteritis, glossitis, pseudomembranous/ <i>C.difficile</i> colitis
Hepatobiliary Disorders	abnormal hepatic function, increased hepatic enzymes, increased alkaline phosphatase
Immune System Disorders	allergic reaction
Infections and Infestations	genital moniliasis
Metabolism and Nutrition Disorders	hyperglycemia, hypoglycemia, hyperkalemia
Musculoskeletal and Connective Tissue Disorders	tendinitis, arthralgia, myalgia, skeletal pain
Nervous System Disorders	tremor, convulsions, paresthesia, vertigo, hypertonia, hyperkinesias, abnormal gait, somnolence <sup>a</sup> , syncope
Psychiatric Disorders	anxiety, agitation, confusion, depression, hallucination, nightmare <sup>a</sup> , sleep disorder <sup>a</sup> , anorexia, abnormal dreaming <sup>a</sup>
Renal and Urinary Disorders	abnormal renal function, acute renal failure
Respiratory, Thoracic and Mediastinal Disorders	epistaxis

System/Organ Class	Adverse Reaction
Skin and Subcutaneous Tissue Disorders	urticaria
Vascular Disorders	phlebitis

 $<sup>^{</sup>a}N = 7274$ 

Rare (<0.1%) adverse reactions from Phase III studies include dyspnea and rash maculopapular.

In clinical trials using multiple-dose therapy, ophthalmologic abnormalities, including cataracts and multiple punctate lenticular opacities, have been noted in patients undergoing treatment with other quinolones. The relationship of the drugs to these events is not presently established.

Crystalluria and cylindruria have been reported with other quinolones.

#### **Abnormal Hematologic and Clinical Chemistry Findings**

Laboratory abnormalities seen in > 2% of patients receiving multiple doses of levofloxacin: decreased glucose 2.1%

It is not known whether this abnormality was caused by the drug or the underlying condition being treated.

#### **Pediatric Data**

In a group of 1534 pediatric patients (6 months to 16 years of age) treated with levofloxacin for respiratory infections, children 6 months to 5 years of age received 10 mg/kg of levofloxacin twice a day for approximately 10 days and children greater than 5 years of age received 10 mg/kg to a maximum of 500 mg of levofloxacin once a day for approximately 10 days. The adverse reaction profile was similar to that reported in adult patients. Vomiting and diarrhea were reported more frequently in children than reported in adults. However, the frequency of vomiting and diarrhea was similar in levofloxacin-treated and non-fluoroquinolone antibiotic comparator-treated children.

A subset of 1340 of these children treated with levofloxacin for approximately 10 days was enrolled in a prospective, long-term, surveillance study to assess the incidence of protocoldefined musculoskeletal disorders (arthralgia, arthritis, tendonopathy, gait abnormality) during 60 days and 1 year following the first dose of levofloxacin.

During the 60-day period following the first dose, the incidence of protocol-defined musculoskeletal disorders was greater in levofloxacin-treated children than in non-fluoroquinolone antibiotic comparator-treated children (2.1% vs. 0.9%, respectively [p=0.038]). In 22/28 (78%) of these children, reported disorders were characterized as arthralgia. A similar observation was made during the one-year period, with a greater incidence of protocol-defined musculoskeletal disorders in levofloxacin-treated children than in non-fluoroquinolone antibiotic comparator-treated children (3.4% vs. 1.8%, respectively [p=0.025]). The majority of these disorders occurring in children treated with levofloxacin were mild and resolved within 7 days. Disorders were moderate in 8 children and mild in 35 (76%) children.

#### **Post-market Adverse Drug Reactions**

Table 1.3 lists adverse reactions that have been identified during post-approval use of levofloxacin. Because these reactions are reported voluntarily from a population of uncertain size, reliably estimating their frequency or establishing a causal relationship to drug exposure is not always possible.

**Table 1.3: Post-marketing Reports of Adverse Drug Reactions** 

Table 1.5: Post-marketing Reports of	
System Organ Class	Adverse Reaction
Blood and Lymphatic System Disorders	pancytopenia, aplastic anemia, leucopenia, hemolytic
	anemia, eosinophilia, thrombocytopenia including
	thrombotic thrombocytopenic purpura, agranulocytosis
Cardiac Disorders	isolated reports of torsades de pointes,
	electrocardiogram QT prolonged, tachycardia
Eye Disorders	uveitis, vision disturbance (including diplopia), visual
	acuity reduced, vision blurred, scotoma
Ear and Labyrinth Disorders	hypoacusis, tinnitus
General Disorders and Administration	multi-organ failure, pyrexia, rash
Site Conditions	
Hepatobiliary Disorders	hepatic failure (including fatal cases), hepatitis,
T C A D	jaundice, hepatic necrosis
Immune System Disorders	hypersensitivity reactions, sometimes fatal including:
	anaphylactic/anaphylactoid reactions, anaphylactic
T	shock, angioneurotic edema, serum sickness
Investigations	prothrombin time prolonged, international normalized
	ratio (INR) prolonged, muscle enzymes increased
Musculoskeletal and Connective Tissue	(CPK)
Disorders	tendon rupture, muscle injury (including rupture), rhabdomyolysis, myositis, myalgia
Nervous System Disorders	anosmia, ageusia, parosmia, dysgeusia, peripheral
Nervous System Disorders	neuropathy (may be irreversible), isolated reports of
	encephalopathy, abnormal EEG, dysphonia
	exacerbation of myasthenia gravis, amnesia,
	pseudotumor cerebri
Psychiatric Disorders	psychosis, paranoia, isolated reports of suicide attempt
2 57 5	and suicidal ideation
Renal and Urinary Disorders	interstitial nephritis, nephrosis, glomerulonephritis
Respiratory, Thoracic and Mediastinal	isolated reports of allergic pneumonitis, interstitial
Disorders	pneumonia, laryngeal edema, apnea
Skin and Subcutaneous Tissue Disorders	bullous eruptions to include: Stevens-Johnson
	Syndrome, toxic epidermal necrolysis, erythema
	multiforme, photosensitivity/phototoxicity reaction,
	leukocytoclastic vasculitis
Vascular Disorders	vasodilation, vasculitis, DIC

#### **DRUG INTERACTIONS**

#### **Overview**

Levofloxacin undergoes limited metabolism in humans and is primarily excreted as unchanged drug in the urine. The P450 system is not involved in the levofloxacin metabolism, and is not affected by levofloxacin. Levofloxacin is unlikely to alter the pharmacokinetics of drugs metabolized by these enzymes. Disturbances of blood glucose have been reported in patients treated concomitantly with levofloxacin and an antidiabetic agent. Therefore, careful monitoring of blood glucose is recommended when these agents, including levofloxacin, are coadministered. As with all other quinolones, iron and antacids significantly reduced bioavailability of levofloxacin.

#### **Drug-Drug Interactions**

**Table 1.4: Established or Potential Drug-Drug Interactions** 

Proper name	Ref	Effect	Clinical comment
Antacids, Sucralfate, Metal Cations, Multi- Vitamins	T	Tablets: Due to the chelation of levofloxacin by multivalent cations, concurrent administration of levofloxacin tablets with antacids containing calcium, magnesium, or aluminum, as well as sucralfate, metal cations such as iron, multivitamin preparations with zinc, or any products containing any of these components may interfere with the gastrointestinal absorption of levofloxacin, resulting in systemic levels considerably lower than desired.	These agents should be taken at least 2 hours before or 2 hours after levofloxacin tablet administration.
Antidiabetic Agents	С	Disturbances of blood glucose, including hyperglycemia and hypoglycemia, have been reported in patients treated concomitantly with levofloxacin and an antidiabetic agent. Some of these cases were serious including hypoglycemic coma.	Careful monitoring of blood glucose is recommended when these agents, including levofloxacin, are co-administered.
Cyclosporine	СТ	No significant effect of levofloxacin on the peak plasma concentrations, AUC, and other disposition parameters for cyclosporine was detected in a clinical study involving healthy volunteers. However, elevated serum levels of cyclosporine have been reported in the patient population when coadministered with some other quinolones. Levofloxacin C <sub>max</sub> and k <sub>e</sub> were slightly lower, while T <sub>max</sub> and t <sub>½</sub> were slightly longer in the presence of cyclosporine, than those observed in other studies without concomitant medication. The differences, however, are not	No dosage adjustment is required for levofloxacin or cyclosporine when administered concomitantly.

Proper name	Ref	Effect	Clinical comment
		considered to be clinically significant.	
Digoxin	СТ	No significant effect of levofloxacin on the peak plasma concentrations, AUC, and, other disposition parameters for digoxin was detected in a clinical study involving healthy volunteers. Levofloxacin absorption and disposition kinetics were similar in the presence or absence of digoxin.	No dosage adjustment for levofloxacin or digoxin is required when administered concomitantly. Digoxin levels should be closely monitored in patients receiving concomitant therapy with digoxin.
Non-Steroidal Anti- Inflammatory Drugs (NSAIDs)	T	Although not observed with levofloxacin in clinical trials, some quinolones have been reported to have proconvulsant activity that is exacerbated with concomitant use of NSAIDs.	The concomitant administration of a non-steroidal anti-inflammatory drug with a quinolone, including levofloxacin, may increase the risk of CNS stimulation and convulsive seizures (see WARNINGS AND PRECAUTIONS; Neurologic and Product Monograph Part II, DETAILED PHARMACOLOGY, Animal Pharmacology).
Probenecid and Cimetidine	СТ	No significant effect of probenecid or cimetidine on the rate and extent of levofloxacin absorption was observed in a clinical study involving healthy volunteers. The AUC and t <sub>1/2</sub> of levofloxacin were 27-38% and 30% higher, respectively, while CL/F and Cl <sub>r</sub> were 21-35% lower during concomitant treatment with probenecid or cimetidine compared to levofloxacin alone.	No dosage adjustment for levofloxacin is required when administered concomitantly with probenecid or cimetidine except dosage adjustment for levofloxacin may be required based on the renal function of the patient.

Proper name	Ref	Effect	Clinical comment
Theophylline	CT/T	No significant effect of levofloxacin on the plasma concentrations, AUC, and other disposition parameters for theophylline was detected in a clinical study involving 14 healthy volunteers. Similarly, no apparent effect of theophylline on levofloxacin absorption and disposition was observed. However, concomitant administration of other quinolones with theophylline has resulted in prolonged elimination, elevated serum theophylline levels, and a subsequent increase in the risk of theophylline-related adverse reactions in the patient population.	Theophylline levels should be closely monitored, and theophylline dosage adjustments made if appropriate, when levofloxacin is coadministered. Adverse reactions, including seizures, may occur with or without an elevation in serum theophylline level (see WARNINGS AND PRECAUTIONS, Neurologic).
Warfarin_	Т	Certain quinolones, including levofloxacin, may enhance the effects of oral anticoagulant warfarin or its derivatives.	When these products are administered concomitantly, prothrombin time, International Normalized Ratio (INR), or other suitable coagulation tests should be monitored closely, especially in elderly patients.
Zidovudine	СТ	Levofloxacin absorption and disposition in HIV-infected subjects, with or without concomitant zidovudine treatment, were similar. The effect of levofloxacin on zidovudine pharmacokinetics has not been studied.	No dosage adjustment for levofloxacin appears to be required when co-administered with zidovudine.

Legend: C = Case Study; CT = Clinical Trial; T = Theoretical

#### **Drug-Food Interactions**

APO-LEVOFLOXACIN may be taken with or without food.

#### **Drug-Herb Interactions**

Interactions with herbal products have not been established.

#### **Drug-Laboratory Interactions**

Some quinolones, including levofloxacin, may produce false-positive urine screening results for opiates using commercially available immunoassay kits. Confirmation of positive opiate screens by more specific methods may be necessary.

#### DOSAGE AND ADMINISTRATION

#### **Dosing Considerations**

The dosage of APO-LEVOFLOXACIN tablets for patients with normal renal function (i.e., Cl<sub>Cr</sub>, > 80 mL/min) is described in the following dosing chart. For patients with altered renal function

(i.e., Cl<sub>Cr</sub> ≤ 80 mL/min), see Patients with Impaired Renal Function subsection.

#### **Recommended Dose and Dosage Adjustment**

Patients with Normal Renal Function

Infection*	Dose	Freq.	Duration
Acute Bacterial Exacerbation of Chronic Bronchitis	500 mg	q24h	7 days
	750 mg	q24h	5 days
Comm Acquired Pneumonia	500 mg	q24h	7-14 days (10-14 days for severe infections)
	750 mg**	q24h	5 days
Sinusitis	500 mg	q24h	10-14 days
	750 mg***	q24h	5 days
Nosocomial Pneumonia	750 mg	q24h	7-14 days
Uncomplicated SSSI	500 mg	q24h	7-10 days
Complicated SSSI	750 mg	q24h	7-14 days
Chronic Bacterial Prostatitis	500 mg	q24h	28 days
Complicated UTI	250 mg	q24h	10 days
	750 mg <sup>‡</sup>	q24h	5 days
Acute Pyelonephritis	250 mg	q24h	10 days
	750 mg	q24h	5 days
Uncomplicated UTI	250 mg	q24h	3 days

- \* DUE TO THE DESIGNATED PATHOGENS (see INDICATIONS AND CLINICAL USE).
- \*\* Efficacy of this alternative regimen has only been documented for infections caused by penicillin-susceptible *Streptococcus* pneumoniae, *Haemophilus influenzae*, *Haemophilus parainfluenzae*, *Mycoplasma pneumoniae*, *Chlamydia pneumoniae*, and *Legionella pneumophilia*.
- \*\*\* The efficacy of a regimen of 750 mg daily for 5 days has been demonstrated to be non-inferior to a regimen of 500 mg daily for 10 days. The 750 mg daily 5-day regimen has not been compared to a regimen of 500 mg daily for 11-14 days.
  - The efficacy of this alternative regimen has been documented for infections caused by *Escherichia coli, Klebsiella pneumoniae, and Proteus mirabilis*. Efficacy against infections caused by *Enterococcus faecalis, Enterobacter cloacae*, or *Pseudomonas aeruginosa* has not been demonstrated with this regimen.

#### **Patients with Impaired Renal Function**

On the basis of the altered levofloxacin disposition pharmacokinetics in subjects with impaired renal function, dose adjustment is recommended for patients with impaired renal function as given below (see WARNINGS AND PRECAUTIONS, Renal; ACTION AND CLINICAL

#### PHARMACOLOGY, Special Populations and Conditions, Renal Insufficiency and Product Monograph Part II: DETAILED PHARMACOLOGY, Factors Influencing the Pharmacokinetics, Special Populations, Renal Insufficiency).

Dosing recommendations for renally impaired patients are based on data collected from a clinical safety and pharmacokinetic study in renally impaired patients treated with a single 500 mg oral dose of levofloxacin. There is no clinical experience available in this patient population for the 250 mg dose or 750 mg dose. Pharmacokinetic modelling was used to determine a recommended dosing regimen which would provide equivalent drug exposures for which clinical efficacy has been demonstrated. The potential effects of levofloxacin associated with possible increased serum/tissue levels in renal-impaired patients, such as effect on QTc interval, have not been studied.

Renal Status	Initial Dose Subsequent Dose			
Acute Sinusitis / Acute Bacterial Exacerbation of Chronic Bronchitis / Community Acquired				
Pneumonia / Uncomplicated SS	Pneumonia / Uncomplicated SSSI / Chronic Bacterial Prostatitis			
Cl <sub>Cr</sub> from 50 to 80 mL/min	No dosage adjustment re	equired		
Cl <sub>Cr</sub> from 20 to 49 mL/min	500 mg	250 mg q24h		
Cl <sub>Cr</sub> from 10 to 19 mL/min	500 mg	250 mg q48h		
Hemodialysis	500 mg	250 mg q48h		
CAPD	500 mg	250 mg q48h		
Complicated UTI / Acute Pyelor	Complicated UTI / Acute Pyelonephritis			
$Cl_{Cr} \ge 20 \text{ mL/min}$	No dosage adjustment re	equired		
Cl <sub>Cr</sub> from 10 to 19 mL/min	250 mg	250 mg q48h		
Complicated SSSI / Nosocomial	Pneumonia / Community	Acquired Pneumonia / Acute Bacterial		
<b>Exacerbation of Chronic Bronc</b>	Exacerbation of Chronic Bronchitis/ Acute Sinusitis/Complicated UTI/Acute Pyelonephritis			
Cl <sub>Cr</sub> from 50 to 80 mL/min	No dosage adjustment re	equired		
Cl <sub>Cr</sub> from 20 to 49 mL/min	750 mg	750 mg q48h		
Cl <sub>Cr</sub> from 10 to 19 mL/min	750 mg	500 mg q48h		
Hemodialysis	750 mg	500 mg q48h		
CAPD	750 mg	500 mg q48h		
<b>Uncomplicated UTI</b>	No dosage adjustment required			

 $Cl_{Cr} =$  creatinine clearances

CAPD = chronic ambulatory peritoneal dialysis

When only the serum creatinine is known, the following formula may be used to estimate creatinine clearance.

Men: Creatinine Clearance (mL/min)

Weight (kq) x (140 - age) x 1.2 serum creatinine (mcmol/L)

0.85 x the value calculated for men. Women:

The serum creatinine should represent a steady state of renal function.

#### **Miss**ed Dose

More than the prescribed dose of APO-LEVOFLOXACIN should not be taken, even if a dose is missed.

#### **Administration**

#### **Tablets**

APO-LEVOFLOXACIN can be administered without regard to food. Doses should be administered at least 2 hours before or 2 hours after antacids containing calcium, magnesium, aluminum, sucralfate, metal cations such as iron, multi-vitamin preparations with zinc, or products containing any of these components.

#### **OVERDOSAGE**

For management of a suspected drug overdose, contact your regional Poison Control Centre immediately.

In the event of an acute overdosage, activated charcoal may be administered to aid in the removal of unabsorbed drug. General supportive measures are recommended. The patient should be observed, including ECG monitoring (see **ACTION AND CLINICAL** 

#### PHARMACOLOGY,

<u>Pharmacodynamics</u>, <u>Studies Measuring Effects on QT and Corrected QT (QTc) Intervals</u>), and appropriate hydration maintained. Treatment should be supportive. Levofloxacin is not efficiently removed by hemodialysis or peritoneal dialysis.

Levofloxacin exhibits a low potential for acute toxicity. Mice, rats, dogs and monkeys exhibited the following clinical signs after receiving a single high dose of levofloxacin: ataxia, ptosis, decreased locomotor activity, dyspnea, prostration, tremors, and convulsions. Doses in excess of 1500 mg/kg orally produced significant mortality in rodents.

# **ACTION AND CLINICAL PHARMACOLOGY Mechanism of Action**

Levofloxacin is a synthetic broad-spectrum antibacterial agent for oral administration and intravenous administration.

Levofloxacin is the L-isomer of the racemate, ofloxacin, a quinolone antibacterial agent. The antibacterial activity of ofloxacin resides primarily in the L-isomer. The mechanism of action of levofloxacin and other quinolone antibacterials involves inhibition of bacterial topoisomerase II (DNA gyrase) and topoisomerase IV. Topoisomerases are essential in controlling the topological state of DNA, and are vital for DNA replication, transcription, repair and recombination.

Fluoroquinolones, including levofloxacin, differ in chemical structure and mode of action from other classes of antimicrobial agents, such as  $\beta$ -lactam antibiotics, aminoglycosides, and macrolides. Therefore, microorganisms resistant to these latter classes of antimicrobial agents may be susceptible to fluoroquinolones. For example,  $\beta$ -lactamase production and alterations in penicillin-binding proteins have no effect on levofloxacin activity. Conversely, microorganisms resistant to fluoroquinolones may be susceptible to other classes of antimicrobial agents.

#### **Pharmacodynamics**

#### Studies Measuring Effects on QT and Corrected QT (QTc) Intervals

Two studies have been conducted to assess specifically the effect of levofloxacin on QT and corrected OT (OTc) intervals in healthy adult volunteers. In a dose escalation study (n=48) where the effect on average QTc, after single doses of 500, 1000, and 1500 mg of levofloxacin, was measured between the baseline OTc (calculated as the average OTc measured 24, 20, 16 hours and immediately before treatment) and the average post-dose QTc interval (calculated from measurements taken every half hour for two hours and at 4, 8, 12 and 24 hours after treatment), an effect on the average QTc (Bazett) was -1.84, 1.55 and 6.40 msec, respectively. In a study which compared the effect of 3 antimicrobials (n=48) where the difference was measured between the baseline QTc (calculated as the average QTc measured 24, 20, 16 hours and immediately before treatment) and the average post-dose QTc interval (calculated from measurements taken every half hour for four hours and at 8, 12 and 24 hours after treatment), an effect on the average QTc was an increase of 3.58 msec after the 1000 mg dose of levofloxacin. The mean increase compared to baseline of QTc at C<sub>max</sub> in these two trials was 7.82 msec and 5.32 msec after a single 1000 mg dose. In these trials, no effect on QT intervals compared to placebo was evident at any of the doses studied. The clinical relevance of the results of these studies is not known (see *Product Monograph Part II*: DETAILED PHARMACOLOGY, Human Pharmacology, Studies Measuring the Effects on QT and Corrected QT (QTc) Intervals).

#### **Pharmacokinetics**

The mean ( $\pm$  SD) pharmacokinetic parameters of levofloxacin determined under single and steady-state conditions following oral (p.o.) or intravenous (i.v.) doses of levofloxacin are summarized in Table 1.5.

Table 1.5: Summary of P	harmaco	kinetic Paramet	ers (mean ±	: SD)				
Regimen	N	C <sub>max</sub>	T <sub>max</sub>	AUCi	CL/F	Vd/F	T <sub>1/2</sub>	Cl <sub>r</sub>

#### **Absorption:**

#### Oral

Levofloxacin is rapidly and essentially completely absorbed after oral administration. Peak plasma concentrations are usually attained 1 to 2 hours after oral dosing. The absolute bioavailability of a 500 mg tablet and a 750 mg tablet of levofloxacin is approximately 99% in both cases, demonstrating complete oral absorption of levofloxacin. Levofloxacin pharmacokinetics are linear and predictable after single and multiple oral dosing regimens. Steady-state conditions are reached within 48 hours following a 500 mg or 750 mg once-daily dosage regimen. The peak and trough plasma concentrations attained following multiple once-daily oral dosage regimens were approximately 5.7 mcg/mL and 0.5 mcg/mL after the 500 mg doses, and 8.6 mcg/mL and 1.1 mcg/mL after the 750 mg doses, respectively.

There was no clinically significant effect of food on the extent of absorption of levofloxacin. Oral administration with food slightly prolongs the time to peak concentration by approximately 1 hour, and slightly decreases the peak concentration by approximately 14%. Therefore, levofloxacin can be administered without regard to food.

#### **Distribution:**

The mean volume of distribution of levofloxacin generally ranges from 74 to 112 L after single and multiple 500 mg or 750 mg doses, indicating widespread distribution into body tissues. Levofloxacin reaches its peak levels in skin tissues (11.7 mcg/g for a 750 mg dose) and in blister fluid (4.33 mcg/g for a 500 mg dose) at approximately 3 to 4 hours after dosing. The skin tissue biopsy to plasma AUC ratio is approximately 2. The blister fluid to plasma AUC ratio is approximately 1, following multiple once-daily oral administration of 750 mg and 500 mg levofloxacin to healthy subjects, respectively. Levofloxacin also penetrates into lung tissues. Lung tissue concentrations were generally 2- to 5-fold higher than plasma concentrations, and ranged from approximately 2.4 to 11.3 mcg/g over a 24-hour period after a single 500 mg oral dose.

Levofloxacin is 24 to 38% bound to serum proteins across all species studied. Levofloxacin binding to serum proteins is independent of the drug concentration.

#### **Metabolism:**

Levofloxacin is stereochemically stable in plasma and urine, and does not invert metabolically to its enantiomer, D-ofloxacin. Levofloxacin undergoes limited metabolism in humans, and is primarily excreted as unchanged drug (87%) in the urine within 48 hours.

#### **Excretion:**

The major route of elimination of levofloxacin in humans is as unchanged drug in the urine. The mean terminal plasma elimination half-life of levofloxacin ranges from approximately 6 to 8 hours following single or multiple doses of levofloxacin given orally.

#### **Special Populations and Conditions**

**Pediatrics:** The pharmacokinetics of levofloxacin in pediatric patients have not been studied.

**Geriatrics:** There are no significant differences in levofloxacin pharmacokinetics between young and elderly subjects when the subjects' differences in creatinine clearance are taken into

consideration. Drug absorption appears to be unaffected by age. Levofloxacin dose adjustment based on age alone is not necessary.

**Gender:** There are no significant differences in levofloxacin pharmacokinetics between male and female subjects when the differences in creatinine clearance are taken into consideration. Dose adjustment based on gender alone is not necessary.

**Race:** The apparent total body clearance and apparent volume of distribution were not affected by race in a covariate analysis performed on data from 72 subjects.

**Hepatic Insufficiency:** Pharmacokinetic studies in hepatically impaired patients have not been conducted. Due to the limited extent of levofloxacin metabolism, the pharmacokinetics of levofloxacin are not expected to be affected by hepatic impairment.

**Renal Insufficiency:** Pharmacokinetic parameters of levofloxacin following oral or intravenous doses of levofloxacin in patients with impaired renal function (creatinine clearance ≤80 mL/min) are presented in Table 1.5. Clearance of levofloxacin is reduced and plasma elimination half-life is prolonged in this patient population. Dosage adjustment may be required in such patients to avoid accumulation

A dosage reduction is being recommended depending on the levels of renal insufficiency. Dosing recommendations are based on pharmacokinetic modelling of data collected from a clinical safety and pharmacokinetic study in renally impaired patients treated with a single 500 mg oral dose of levofloxacin (see WARNINGS AND PRECAUTIONS, Renal, and DOSAGE AND ADMINISTRATION, Recommended Dose and Dosage Adjustment, Patients with Impaired Renal Function).

Neither hemodialysis nor continuous ambulatory peritoneal dialysis (CAPD) is effective in removal of levofloxacin from the body, indicating supplemental doses of levofloxacin are not required following hemodialysis or CAPD.

**Bacterial Infection:** The pharmacokinetics of levofloxacin in patients with community-acquired bacterial infections are comparable to those observed in healthy subjects.

#### STORAGE AND STABILITY

Store at room temperature (15°C to 30°C), protected from light.

#### DOSAGE FORMS, COMPOSITION AND PACKAGING

APO-LEVOFLOXACIN (Levofloxacin) 250 mg Tablets are supplied as terra cotta pink, capsule-shaped, biconvex, film-coated tablets. Engraved "APO" on one side and "LFX 250" on the other side. Available in bottles of 100 tablets.

APO-LEVOFLOXACIN (Levofloxacin) 500 mg Tablets are supplied as peach, capsule-shaped, biconvex, film-coated tablets. Engraved "APO" on one side and "LFX 500" on the other side. Available in bottles of 100 tablets.

APO-LEVOFLOXACIN (Levofloxacin) 750 mg Tablets are supplied as white to off-white, capsule-shaped, biconvex, film-coated tablets. Engraved "APO" on one side and "LFX 750" on the other side. Available in bottles of 100 tablets

APO-LEVOFLOXACIN (levofloxacin) Tablets are available as film-coated tablets and contain the following inactive ingredients:

250 mg: croscarmellose sodium, magnesium stearate, colloidal silicon dioxide,

methylcellulose, stearic acid, hydroxypropyl methylcellulose, hydroxypropyl

cellulose, polyethylene glycol, titanium dioxide, red ferric oxide.

500 mg: croscarmellose sodium, magnesium stearate, colloidal silicon dioxide,

methylcellulose, stearic acid, hydroxypropyl methylcellulose, hydroxypropyl

cellulose, polyethylene glycol, titanium dioxide, red ferric oxide, yellow ferric oxide.

750 mg croscarmellose sodium, magnesium stearate, colloidal silicon dioxide,

methylcellulose, stearic acid, hydroxypropyl methylcellulose, hydroxypropyl

cellulose, polyethylene glycol, titanium dioxide.

#### PART II: SCIENTIFIC INFORMATION

#### PHARMACEUTICAL INFORMATION

**Drug Substance** 

Proper Name: levofloxacin hemihydrate

Chemical Name: (S)-9-fluoro-2,3-dihydro-3-methyl-10-(4-methyl-1-piperazinyl)-7-

oxo-7H-pyrido[1,2,3-de]-1,4-benzoxazine-6-carboxylic acid

hemihydrate

Molecular formula and molecular mass:  $C_{18}H_{20}FN_3O_{4\simeq}\frac{1}{2}H_2O$ , 370.38 g/mol (levofloxacin

hemihydrate)

C<sub>18</sub>H<sub>20</sub>FN<sub>3</sub>O<sub>4</sub>, 361.37 g/mol (anhydrous levofloxacin)

Structural Formula:

Physicochemical properties:

Levofloxacin is a light yellow powder with a melting point of 225°C to 227°C. The p $K_a$  values for levofloxacin are 5.33 and 8.07 for p $K_{a1}$  and p $K_{a2}$ , respectively. The molecule exists as a zwitterion at the pH conditions in the small intestine.

The data demonstrate that, from pH 0.6 to 5.8, the solubility of levofloxacin is essentially constant (approximately 100 mg/mL). Levofloxacin is considered *soluble* to *freely soluble* in this pH range, as defined by USP nomenclature. Above pH 5.8, the solubility increases rapidly to its maximum at pH 6.7 (272 mg/mL), and is considered *freely soluble* in this range. Above pH 6.7, the solubility decreases and reaches a minimum value (about 50 mg/mL) at a pH of approximately 6.9.

Levofloxacin is considered *freely soluble to soluble* at the pH range of 6.7 to 7.7, beyond which the solubility begins to increase again.

Levofloxacin has the potential to form stable co-ordination compounds with many metal ions. This *in vitro* chelation potential has the following formation order:  $Al^{+3} > Cu^{+2} > Zn^{+2} > Mg^{+2} > Ca^{+2}$ .

#### **CLINICAL TRIALS**

#### **Comparative Bioavailability**

A comparative bioavailabilty study was performed on healthy human volunteers under fasting conditions. The rate and extent of absorption of levofloxacin was measured and compared following a single oral dose of APO-LEVOFLOXACIN (levofloxacin) or LEVAQUIN® tablets. The results from measured data are summarized as follows:

Summary Table of the Comparative Bioavailability Data

Levofloxacin (1 x 500 mg Tablet) From Measured Data Uncorrected for Potency Geometric Mean Arithmetic Mean (CV %)

Mycoplasma pneumoniae	32/34 (94.1)
Chlamydia pneumoniae	20/22 (90.9)
Legionella pneumophila	12/12 (100.0)

#### 7 to 14 Day Treatment Regimen

In three North American clinical studies, of 655 patients treated with levofloxacin for community-acquired pneumonia, 45 clinically and microbiologically evaluable patients were defined as severely ill by study criteria and met American Thoracic Society criteria for severe community-acquired pneumonia (American Thoracic Society, 1993). Clinical success (cure and improvement) was achieved in 98% of these 45 patients. Data on the treatment of patients with severe Legionella pneumonia is limited to one patient.

Data on the treatment of community-acquired pneumonia due to penicillin-resistant *S. pneumoniae* is limited to 12 evaluable patients from the combined clinical trials database. Of these, 4 were considered to have been severe. All 12 patients achieved clinical success (see **MICROBIOLOGY**).

The following tables describe the results from the two pivotal trials for community-acquired pneumonia (7 to 14 day treatment regimen).

**Table 2.10 - Clinical Success<sup>a</sup> in Pivotal Community-Acquired Pneumonia Studies - Clinically Evaluable Subjects**

At posttherapy visit (10 to 14 days after last active dose of levofloxacin and 5-9 days after last active dose of ciprofloxacin).

Intent-to-treat population. Patients with AP complicated by underlying renal diseases or conditions such as complete obstruction, surgery, transplantation, concurrent infection or congenital malformation were excluded.

Two-sided 95% confidence interval around the difference (comparator minus levofloxacin).

The mITT population included patients who had a clinical diagnosis of AP or cUTI and who had a positive (≥10 CFU/mL) urine culture with no more than 2 uropathogens at Study Entry.

In the mITT population there were a limited number of patients treated with IV therapy (levofloxacin-8, comparator-9), with catheters

<sup>(</sup>levofloxacin-4, comparator-5) and with bacteremia (levofloxacin-13, comparator-12).

The microbiologically evaluable population included patients with a confirmed diagnosis of cUTI or AP according to the protocol-specified inclusion criteria and with a known uropathogen with adequate growth  $(\ge 10^{\circ} \text{ CFU/mL})$  who met all other microbiologic evaluability criteria.

In the microbiologically evaluable population there were a limited number of patients treated with IV therapy (levofloxacin-4, comparator-3), with catheters (levofloxacin-3, comparator-3) and with bacteremia (levofloxacin-10, comparator-8).

Difference in eradication rates (comparator minus levofloxacin).

 $^{\rm g}$  Two-sided 95% confidence interval around the difference (comparator minus levofloxacin) in microbiologic eradication rates.

## **DETAILED PHARMACOLOGY**

## **Animal Pharmacology**

Pharmacodynamics

A summary of the major findings obtained from animal pharmacology studies with levofloxacin is presented below:

Table 2.47 - Summary of Major Nonclinical Pharmacological Effects of Levofloxacin

System	Species	Major Findings
Central Nervous System	mouse	≥600 mg/kg, p.o., decreased spontaneous locomotor activity, CNS depression, decreased pinna reflex, decrease writhing response to acetic acid; increased incidences of strychnine-, pentylenetetrazoland caffeine-induced convulsions; ≥200 mg/kg, i.v., convulsions after rapid injection, decreased spontaneous motor activity, muscle tone, posture, body temperature; increased respiratory rate; prolonged hexobarbital sleep time
	rat	At 200 mg/kg, i.v., inhibition of conditioned-avoidance response; At 200 mg/kg, i.p., increased spontaneous motor activity, lowered body posture, increased restlessness
	rabbit	At 200 mg/kg, p.o., decrease in body temperature
	cat	≥6 mg/kg, i.v., decreased spinal reflex ≥30 mg/kg, i.v., increased EEG awake stage, seizure discharges
Autonomic Nervous System	cat	At 20 mg/kg, i.v., reduced contractile response of nictitating membrane to pre and postganglionic stimulation; suppression of acetylcholine depressor response
Cardiopulmonary System	dog	≥6 mg/kg, i.v. bolus, decreases in blood pressure, left ventricular pressure, respiration depth; ≤10 mg/kg, i.v. infusion, no effect on blood pressure; ≥20 mg/kg i.v. infusion, decrease in blood pressure, decrease in cardiac output and stroke volume; increase in serum histamine concentrations
Gastrointestinal System	mouse	At 200 mg/kg, i.v., inhibition of gastric propulsion.
	rat	≥200 mg/kg, p.o., decrease in gastric fluid volume, total acidity, pepsin output; increase in gastric fluid pH; at 600 mg/kg, decrease in gastric emptying; at 200 mg/kg, i.v., decrease in gastric fluid volume, acid and pepsin output and gastric emptying; increase in gastric pH
Urinary Tract	rat	≥200 mg/kg, p.o., decrease in urinary volume and electrolyte excretion; at 200 mg/kg, i.v., decrease in urinary volume
Inflammation	rat	At 600 mg/kg, p.o., inhibition of carrageenan-induced foot edema
Isolated Smooth Muscles		On dog mesenteric, renal, femoral, and basilar arteries, inhibition of norepinephrine-induced contractions $\geq 10 \times 10^{-6}$ M; competitive inhibition of phenylephrine-induced contractions of rabbit thoracic artery

In mice, the CNS stimulatory effect of quinolones is enhanced by concomitant administration of non-steroidal anti-inflammatory drugs.

*In vitro* and *in vivo* studies in animals indicate that levofloxacin is neither an enzyme inducer nor inhibitor in the human therapeutic plasma concentration range; therefore, no drug metabolizing enzyme-related interactions with other drugs or agents are anticipated.

## **Human Pharmacology**

**Pharmacodynamics** 

## Studies Measuring the Effects on QT and Corrected QT (QTc) Intervals

Two double-blind, placebo-controlled studies assessing the effect of levofloxacin on QTc intervals in healthy male and female volunteers 18 to 84 years of age were conducted. Each had a four-treatment crossover, single-dose study design. One study evaluated dose-response. The other was a comparative study that involved measuring the effects of doses of levofloxacin and two other fluoroquinolones. In this comparative study, subjects were given twice the doses of these antibiotics that are recommended for the treatment of otherwise healthy subjects with community-acquired pneumonia. In both trials, no effect on QT intervals compared to placebo was evident at any of the doses of levofloxacin studied (top panels of figure A and figure B).

**Dose escalation study (Figure A):** In this trial, the mean change in the average QTc interval (calculated from measurements taken every half hour for two hours and at 4, 8, 12 and 24 hours after treatment) from the baseline QTc (calculated as the average QTc measured 24, 20, 16 hours and immediately before treatment) was a decrease of 1.84 msec after treatment with 500 mg, an increase of 1.55 msec after treatment with 1000 mg of levofloxacin and an increase of 6.40 msec after treatment with 1500 mg. The change in QTc interval at C<sub>max</sub> (calculated using the Bazett formula) after treatment with 500 mg of levofloxacin was not significantly different from that measured after treatment with placebo. In this trial, the mean change in the QTc (Bazett) at C<sub>max</sub> from baseline QTc (calculated as the average QTc measured 24, 20, 16 hours and immediately before treatment) was -3.20 msec after treatment with 500 mg of levofloxacin, 7.82 msec after treatment with 1000 mg of levofloxacin and 10.58 msec after treatment with 1500 mg of levofloxacin.

Comparative, placebo-controlled study (Figure B; only levofloxacin and placebo data shown): In this study, the mean change in the average QTc interval (calculated from measurements taken every half hour for four hours and at 8, 12 and 24 hours after treatment) from the baseline QTc (calculated as the average QTc measured 24, 20, 16 hours and immediately before treatment) was 3.58 msec after treatment with 1000 mg levofloxacin. In this study, the change in the QTc (Bazett) at C<sub>max</sub> from a baseline QTc (calculated as the average QTc measured 24, 20, 16 hours and immediately before treatment) was 5.32 msec after treatment with 1000 mg of levofloxacin.

## **Pharmacokinetics**

# Absorption

### Oral

Levofloxacin is rapidly and essentially completely absorbed after oral administration. Peak plasma concentrations are usually attained 1 to 2 hours after oral dosing. The absolute bioavailability of a 500 mg tablet and a 750 mg tablet of levofloxacin is approximately 99% in both cases, demonstrating complete oral absorption of levofloxacin. Levofloxacin pharmacokinetics are linear and predictable after single and multiple oral dosing regimens. After single oral doses of 250 to 1000 mg of levofloxacin to healthy subjects, plasma concentrations increase proportionally with the dose as shown (mean ± SD):

Oral Dose		Peak Plasma Conce	Peak Plasma Concentration Area Under the Curve		
<u>(mg)</u>	<u>n</u>	(mcg/mL)	$(AUC_{0-\alpha_*} mcg.h/mL)$		
250	15	$2.8 \pm 0.4$	$27.2 \pm 3.9$		
500	23	$5.1 \pm 0.8$	$47.9 \pm 6.8$		
750	10	$7.1 \pm 1.4$	$82.2 \pm 14.3$		
1000	10	$8.9 \pm 1.9$	$111.0 \pm 20.8$		

Steady-state conditions are reached within 48 hours following 500 mg or 750 mg once-daily dosage regimens. The peak and trough plasma concentrations attained following multiple once-daily oral

dosage regimens were approximately 5.7 and 0.5 mcg/mL after the 500 mg doses, and 8.6 and 1.1 mcg/mL after the 750 mg doses, respectively.

Oral administration with food slightly prolongs the time to peak concentration by approximately 1 hour and slightly decreases the peak concentration by approximately 14%.

#### Distribution

The mean volume of distribution of levofloxacin generally ranges from 74 to 112 L after single and multiple 500 mg or 750 mg doses, indicating widespread distribution into body tissues. Levofloxacin reaches its peak levels in skin tissues (11.7 mcg/g for a 750 mg dose) and in blister fluid (4.33 mcg/g for a 500 mg dose) at approximately 3 to 4 hours after dosing. The skin tissue biopsy to plasma AUC ratio is approximately 2. The blister fluid to plasma AUC ratio is approximately 1, following multiple once-daily oral administration of 750 mg and 500 mg levofloxacin to healthy subjects, respectively. Levofloxacin also penetrates into lung tissues. Lung tissue concentrations were generally 2- to 5-fold higher than plasma concentrations and range from approximately 2.4 to 11.3 mcg/g over a 24-hour period after a single 500 mg dose. Levofloxacin also penetrates into cortical and spongiosa bone tissues in both the femoral head and distal femur. Peak levofloxacin concentrations in these tissues ranging from 2.4 to 15 mcg/g were generally attained by 2 to 3 hours after a single 500 mg oral dose.

In vitro, over a clinically relevant range (1 to 10 mcg/mL) of serum/plasma levofloxacin concentrations, levofloxacin is approximately 24 to 38% bound to serum proteins across all species studied, as determined by the equilibrium dialysis method. Levofloxacin is mainly bound (approximately 21 to 30%) to serum albumin in humans. Levofloxacin binding to serum proteins is independent of the drug concentration.

### Metabolism

Levofloxacin is stereochemically stable in plasma and urine, and does not invert metabolically to its enantiomer, D-ofloxacin. Levofloxacin undergoes limited metabolism in humans and is primarily excreted as unchanged drug in the urine. Following oral administration, approximately 87% of an administered dose was recovered as unchanged drug in urine within 48 hours, whereas less than 4% of the dose was recovered in feces in 72 hours. Less than 5% of an administered dose was recovered in the urine as the desmethyl and N-oxide metabolites, the only metabolites identified in humans. These metabolites have little relevant pharmacological activity.

#### Excretion

The major route of elimination of levofloxacin in humans is as unchanged drug in the urine. The mean terminal plasma elimination half-life of levofloxacin ranges from approximately 6 to 8 hours following single or multiple doses of levofloxacin given orally or intravenously. The mean apparent total body clearance and renal clearance range from approximately 144 to 226 mL/min and 96 to 142 mL/min, respectively. Renal clearance in excess of the glomerular filtration rate suggests that tubular secretion of levofloxacin occurs in addition to its glomerular filtration. Concomitant administration of either cimetidine or probenecid results in approximately 24 % and 35% reduction in the levofloxacin renal clearance, indicating that secretion of levofloxacin occurs in the renal proximal tubule. No levofloxacin crystals were found in any of the urine samples freshly collected from subjects receiving levofloxacin.

# <u>Factors Influencing the Pharmacokinetics</u> <u>Special Populations</u>

# **Elderly**

There are no significant differences in levofloxacin pharmacokinetics between young and elderly subjects when the subjects' differences in creatinine clearance are taken into consideration. Following a 500 mg oral dose of levofloxacin to healthy elderly subjects (66 to 80 years of age), the mean terminal plasma elimination half-life of levofloxacin was about 7.6 hours, as compared to approximately 6 hours in younger adults. The difference was attributable to the variation in renal function status of the subjects and was not believed to be clinically significant. Drug absorption appears to be unaffected by age. Levofloxacin dose adjustment based on age alone is not necessary.

### **Pediatric**

The pharmacokinetics of levofloxacin in pediatric patients have not been studied.

### Gender

There are no significant differences in levofloxacin pharmacokinetics between male and female subjects when the differences in creatinine clearance are taken into consideration. Following a 500 mg oral dose of levofloxacin to healthy male subjects, the mean terminal plasma elimination half-life of levofloxacin was about 7.5 hours, as compared to approximately 6.1 hours in female subjects. This difference was attributable to the variation in renal function status of the male and female subjects, and was not believed to be clinically significant. Drug absorption appears to be unaffected by the gender of the subjects. Dose adjustment based on gender alone is not necessary.

#### Race

The effect of race on levofloxacin pharmacokinetics was examined through a covariate analysis performed on data from 72 subjects: 48 white and 24 non-white. The apparent total body clearance and apparent volume of distribution were not affected by the race of the subjects.

# **Renal Insufficiency**

Clearance of levofloxacin is reduced and plasma elimination half-life is prolonged in patients with impaired renal function (creatinine clearance  $\leq 80$  mL/min). Dosage adjustment may be required in such patients to avoid levofloxacin accumulation. Neither hemodialysis nor continuous ambulatory peritoneal dialysis (CAPD) is effective in removal of levofloxacin from the body, indicating supplemental doses of levofloxacin are not required following hemodialysis or CAPD (see

ACTION AND CLINICAL PHARMACOLOGY, <u>Pharmacokinetics</u>; WARNINGS AND PRECAUTIONS, <u>Renal</u>, and DOSAGE AND ADMINISTRATION).

## Plasma Ratio

Comparison of the expected steady-state AUC values<sup>a</sup> in renally impaired patients relative to those in patients with normal renal function:

	Creatinine Clearance	Creatinine Clearance	Creatinine Clearance
	50-80 mL/min receiving	20-49 mL/min receiving	<20 mL/min receiving
	500 mg q24h	250 mg q24h	250 mg q48h
AUC value relative to	172%	183%	139%

patients with normal			
renal function receiving			
500 mg q24h			
AUC value relative to	89%	94%	71%
patients with normal			
renal function receiving			
500 mg q12h			

<sup>&</sup>lt;sup>a</sup> Values were extrapolated from the mean levofloxacin plasma concentration-time data in subjects with normal renal function (n = 23) and subjects with impaired renal function (n = 3 for  $Cl_{Cr}$  50-80 mL/min, n = 8 for  $Cl_{Cr}$  20-49 mL/min, and n = 6 for  $Cl_{Cr}$  < 20 mL/min).

## **Urine Concentrations**

The mean ± SD concentrations (mcg/mL) of levofloxacin in the urine following a 500 mg p.o. dose of levofloxacin in subjects with impaired renal function are summarized as follows<sup>a</sup>:

Collection Interval	$Cl_{Cr}$ 50-80 mL/min $N^b = 3$	$Cl_{Cr}$ 20-49 mL/min $N = 8$	$Cl_{Cr} < 20 \text{ mL/min}$ N = 6
	N - 3	N - 8	N = 0
06h	$185 \pm 61.7$	$98.1 \pm 48.1$	$66.5 \pm 27.3$
612h	$91.6 \pm 24.4$	$75.2 \pm 22.1$	$39.0 \pm 23.1$
12 <u></u> 24h	$156 \pm 183$	$58.6 \pm 31.1$	$29.5 \pm 20.7$
2436h	$49.7 \pm 16.2$	$44.1 \pm 10.6$	<25
3648h	<25	<25	<25

<sup>&</sup>lt;sup>a</sup> Limit of quantitation = 25mcg/mL

Expected steady-state urinary concentrations (mcg/mL) of levofloxacin in renally impaired patients with the recommended adjusted dose regimen in the treatment of complicated UTI and acute pyelonephritis<sup>a</sup>:

Collection Interval	Cl <sub>cr</sub> 50-80 mL/min	Cl <sub>cr</sub> 20-49 mL/min	Cl <sub>cr</sub> < 20 mL/min
	receiving 250 mg q24h	receiving 250 mg q24h	receiving 250 mg q48h
06h	161	103	54
612h	61	76	29
1224h	40	58	24
2436h			23
3648h			16

<sup>&</sup>lt;sup>a</sup> Values were extrapolated from the mean pharmacokinetic profiles in subjects with impaired renal function (n = 12 for  $Cl_{cr}$  50 to 80 mL/min, n = 8 for  $Cl_{cr}$  20 to 49 mL/min, and n = 6 for  $Cl_{cr}$  < 20 mL/min).

# **Hepatic Insufficiency**

Pharmacokinetic studies in hepatically impaired patients have not been conducted. Due to the limited extent of levofloxacin metabolism, the pharmacokinetics of levofloxacin are not expected to be affected by hepatic impairment.

### **Bacterial Infection**

The pharmacokinetics of levofloxacin in patients with serious community-acquired bacterial infections are comparable to those observed in healthy subjects.

## **HIV Infection**

 $<sup>^{</sup>b}$  n = number of subjects

The pharmacokinetics of levofloxacin in HIV seropositive subjects (with CD4 cell counts ranging from 17 to 772) are comparable to those observed in healthy subjects.

# **Drug-Drug Interactions**

The potential for pharmacokinetic drug interactions between levofloxacin and theophylline, warfarin, cyclosporine, digoxin, probenecid, cimetidine, sucralfate, zidovudine and antacids has been evaluated (see **DRUG INTERACTIONS**).

### MICROBIOLOGY

Levofloxacin is the L-isomer of the racemate, ofloxacin, a quinolone antibacterial agent. The antibacterial activity of ofloxacin resides primarily in the L-isomer. The mechanism of action of levofloxacin and other quinolone antibacterials involves inhibition of bacterial topoisomerase II (DNA gyrase) and topoisomerase IV, enzymes required for DNA replication, transcription, repair, and recombination. In this regard, the L-isomer produces more hydrogen bonds and therefore, more stable complexes with DNA gyrase than does the D-isomer. Microbiologically, this translates into a 25- to 40-fold greater antibacterial activity for the L-isomer, levofloxacin, over the D-isomer. Quinolones rapidly and specifically inhibit bacterial DNA synthesis.

Levofloxacin has *in vitro* activity against a broad spectrum of gram-positive and gram-negative aerobic and anaerobic bacteria. Levofloxacin is often bactericidal at concentrations equal to or greater than the Minimum Inhibitory Concentrations (MIC). The *in vitro* activity of levofloxacin against clinical isolates is summarized in Table 2.48

Table 2.48 - In Vitro Activity of Levofloxacin Against Clinical Isolates

# of			MIC (mcg/mL)		
Organism	isolates	50%	90%	Range	
Acinetobacter baumannii	(57)	0.120	16.000	0.060 ->16.000	
Acinetobacter calcoaceticus	(48)	0.250	0.250	0.030 - 64.000	
Chlamydia pneumoniae	(10)	0.250	0.250	0.125 - 0.500	
Citrobacter diversus	(20)	0.030	0.030	0.015 - 0.060	
Citrobacter freundii	(50)	0.060	1.000	0.015 - 8.000

Streptococcus pneumoniae, Clarithromycin-resistant (MIC\ge 1.0mcg/mL)\pm	(136)	1.000	2.000	0.12 - 16.000
Streptococcus pneumoniae, erythromycin-resistant (MIC≥1.0mcg/mL)±	(27)	1.000	1.000	0.500 - 16.000
Streptococcus pyogenes	(87)	0.500	1.000	0.250 - 2.000
Streptococcus sanguis	(19)	1.000	2.000	0.250 - 2.000
* As with other drugs in this along some strains of De		1.000	z.000	

<sup>\*</sup> As with other drugs in this class, some strains of *Pseudomonas aeruginosa* may develop resistance fairly rapidly during treatment with levofloxacin.

Levofloxacin is not active against Treponema pallidum (see WARNINGS AND PRECAUTIONS,

<sup>\*\*</sup> Data obtained for isolates from Complicated Skin and Skin Structure clinical studies, and literature, indicate the MIC value has increased for MRSA (see INDICATIONS AND CLINICAL USE for approved organisms).

<sup>±</sup> Based on NCCLS classification

# **Sexually Transmitted Diseases**).

## Resistance

Resistance to levofloxacin due to spontaneous mutation *in vitro* is a rare occurrence (range:  $10^{-9}$  to  $10^{-10}$ ). Although cross-resistance has been observed between levofloxacin and other fluoroquinolones, some organisms resistant to other quinolones, including ofloxacin, may be susceptible to levofloxacin.

# **Susceptibility Tests**

Susceptibility testing for levofloxacin should be performed, as it is the optimal predictor of activity.

# **Dilution Techniques**

Quantitative methods are used to determine antimicrobial minimal inhibitory concentrations (MlCs). These MlCs provide estimates of the susceptibility of bacteria to antimicrobial compounds. The MICs should be determined using a standardized procedure. Standardized procedures are based on a dilution method\*1 (broth or agar) or equivalent with standardized inoculum concentrations and standardized concentrations of levofloxacin powder. The MIC values should be interpreted according to the following criteria:

For testing aerobic microorgansims other than *Haemophilus influenzae*, *Haemophilus parainfluenzae*, and *Streptococcus pneumoniae*:

MIC (mcg/mL)	<u>Interpretation</u>
$\leq 2$	Susceptible (S)
4	Intermediate (I)
≥8	Resistant (R)

For testing Haemophilus influenzae and Haemophilus parainfluenzae:<sup>a</sup>

MIC (mcg/mL)	<u>Interpretation</u>
≤2	Susceptible (S)

<sup>&</sup>lt;sup>a</sup> These interpretive standards are applicable only to broth microdilution susceptibility testing with *Haemophilus influenzae* and *Haemophilus parainfluenzae* using Haemophilus Test Medium\*<sup>1</sup>.

The current absence of data on resistant strains precludes defining any categories other than "Susceptible". Strains yielding MIC results suggestive of a "nonsusceptible" category should be submitted to a reference laboratory for further testing.

For testing Streptococcus pneumoniae:<sup>b</sup>

$\underline{MIC}$ (mcg/mL)	<u>Interpretation</u>
≤2	Susceptible (S)
4	Intermediate (I)
≥8	Resistant (R)

<sup>&</sup>lt;sup>b</sup> These interpretive standards are applicable only to broth microdilution susceptibility tests using cation-adjusted Mueller-Hinton broth with 2-5% lysed horse blood.

A report of "Susceptible" indicates that the pathogen is likely to be inhibited if the antimicrobial compound in the blood reaches the concentrations usually achievable. A report of "Intermediate" indicates that the result should be considered equivocal, and, if the microorganism is not fully susceptible to alternative, clinically feasible drugs, the test should be repeated. This category

implies possible clinical applicability in body sites where the drug is physiologically concentrated or in situations where a high dosage of drug can be used. This category also provides a buffer zone which prevents small uncontrolled technical factors from causing major discrepancies in interpretation. A report of "Resistant" indicates that the pathogen is not likely to be inhibited if the antimicrobial compound in the blood reaches the concentrations usually achievable; other therapy should be selected.

Standardized susceptibility test procedures require the use of laboratory control microorganisms to control the technical aspects of the laboratory procedures. Standard levofloxacin powder should give the following MIC values:

Microorganism		MIC (mcg/mL)
Enterococcus faecalis	ATCC 29212	0.25 - 2
Escherichia coli	ATCC 25922	0.008 - 0.06
Escherichia coli	ATCC 35218	0.015 - 0.06
Pseudomonas aeruginosa	ATCC 27853	0.5 - 4
Staphylococcus aureus	ATCC 29213	0.06 - 0.5
Haemophilus influenzae	ATCC 49247 <sup>C</sup>	0.008 - 0.03
Streptococcus pneumoniae	ATCC 49619 <sup>d</sup>	0.5 - 2

This quality control range is applicable to only *H. influenzae* ATCC 49247 tested by a broth microdilution procedure using Haemophilus Test Medium (HTM)\*1.

# **Diffusion Techniques**

Quantitative methods that require measurement of zone diameters also provide reproducible estimates of the susceptibility of bacteria to antimicrobial compounds. One such standardized procedure \*2 requires the use of standardized inoculum concentrations. This procedure uses paper disks impregnated with 5 mcg levofloxacin to test the susceptibility of microorganisms to levofloxacin. Reports from the laboratory, providing results of the standard single-disk susceptibility test with a 5 mcg levofloxacin disk, should be interpreted according to the following criteria:

For aerobic microorganisms other than *Haemophilus influenzae*, *Haemophilus parainfluenzae*, *Streptococcus pneumoniae* and *Neisseria gonorrhoeae*:

Zone diameter (mm)	<u>Interpretation</u>
≥17	Susceptible (S)
14-16	Intermediate (I)
<13	Resistant (R)

For Haemophilus influenzae and Haemophilus parainfluenzae: e

Zone diameter (mm)	Interpretation
>17	Susceptible (S)

These interpretive standards are applicable only to disk diffusion susceptibility testing with *Haemophilus influenzae* and *Haemophilus parainfluenzae* using Haemophilus Test Medium\* (HIM)<sup>2</sup>.

The current absence of data on resistant strains precludes defining any categories other than "Susceptible". Strains yielding zone diameter results suggestive of a "Nonsusceptible" category should be submitted to a reference laboratory for further testing.

This quality control range is applicable to only S. *pneumoniae* ATCC 49619 tested by a broth microdilution procedure using cation-adjusted Mueller-Hinton broth with 2-5% lysed horse blood.

For Streptococcus pneumoniae:<sup>f</sup>

Zone diameter (mm)	<u>Interpretation</u>	
≥17	Susceptible (S)	
14-16	Intermediate (I)	
<13	Resistant (R)	

These zone diameter standards for *Streptococcus pneumoniae* apply only to tests performed using Mueller-Hinton agar supplemented with 5% sheep blood and incubated in 5% CO<sub>2</sub>.

Interpretation should be as stated above for results using dilution techniques. Interpretation involves correlation of the diameter obtained in the disk test with the MIC for levofloxacin.

As with standardized dilution techniques, diffusion methods require the use of laboratory control microorganisms to control the technical aspects of the laboratory procedures. For the diffusion technique, the 5 mcg levofloxacin disk should provide the following zone diameters in these laboratory test quality control strains:

<u>Microorganism</u>		Zone Diameter (mm)
Escherichia coli	ATCC 25922	29 - 37
Pseudomonas aeruginosa	ATCC 27853	19 - 26
Staphylococcus aureus	ATCC 25923	25 - 30
Haemophilus influenzae	ATCC 49247 <sup>g</sup>	32 - 40
Streptococcus pneumoniae	ATCC 49619 <sup>h</sup>	20 - 25

This quality control range is applicable to only *H. influenzae* ATCC 49247 tested by a disk diffusion procedure using Haemophilus Test Medium (HTM)\*<sup>2</sup>.

#### TOXICOLOGY

The potential toxicity of levofloxacin has been evaluated in acute, sub-chronic, carcinogenicity, mutagenicity, reproduction and teratology, and special toxicity studies.

## **Acute Toxicity**

Table 2.49 - Summary of the acute toxicity studies

	Summing of	the acate		
STRAIN/ SPECIES	# ANIMAL/ GROUP	ROUTE	LD <sub>50</sub> mg/kg	SUMMARY TOXIC SIGNS
Mouse	M-10 F-10	p.o.	1881 1803	↓ locomotor activity, ptosis, respiratory depression, tremor, convulsion
Mouse	M-10	p.o.	1943	↓ locomotor activity, ptosis, prostration, tremor, convulsion
Rat	M-10 F-10	p.o.	1478 1507	salivation, ptosis, ↓ locomotor activity, tremor, convulsion, respiratory depression
Rat	M-10	p.o.	1754	
Monkey	F-2	p.o.	>250	soft stool, transient ↓platelet count and ↑ bw at 250 mg/kg, transient ↑ bilirubin, ↓ bw, and emesis at 500 mg/kg

This quality control range is applicable to only S. *pneumoniae* ATCC 49619 tested by a disk diffusion procedure using Mueller-Hinton agar supplemented with 5% sheep blood and incubated in 5% CO<sub>2</sub>.

STRAIN/	# ANIMAL/	ROUTE	LD <sub>50</sub>	SUMMARY TOXIC SIGNS
SPECIES	GROUP		mg/kg	
Mouse	M-10	i.v.	268	↓ locomotor activity, ptosis, abnormal posture, tachypnea,
	F-10		323	convulsion, dyspnea
Mouse	M-5	i.v.	244	symptoms prior to death: tachypnea, collapse, dyspnea,
				convulsions, respiratory arrest. In survivors,
				↓ locomotor activity and collapse
Rat	M-10	i.v.	423	↓ locomotor activity, prostration followed by respiratory
	F-10		395	depression, tachypnea, dyspnea, convulsion, tremor,
				salivation
Dog	F-2	i.v.	200	salivation, dyspnea, tonic and clonic convulsion, death from
				respiratory arrest at 200 mg/kg, lacrimation, vomiting,
				lethargy, and tremors. ↑ RBC, WBC, ALT and ALP, and ↓ P
				on Day 2. Values returned to normal by Day 8.
Monkey	F-2	i.v.	>200	at 200 mg/kg – ptosis, vomiting, ↓ locomotor activity,
				prostration and anorexia, ketone urine, proteinuria,
				↓ glucose. Ptosis, and emesis at 100 mg/kg.

Signs of acute toxicity with metabolites (desmethyl and N-oxide) were similar to that of levofloxacin and were produced at doses significantly greater than would be encountered with therapeutic use.

# **Sub-Chronic Toxicity**

Table 2.50 - Summary of the sub-chronic toxicity studies

Species, Route,		Results
Age/Grp/No.,	Dosage,	1100 1110
Sex/Grp	<b>Duration</b>

Dosage = mg/kg/day; Clin Obs = clinical observations; Clin Path = clinical pathology; Micro = macroscopic and microscopic findings; NOAEL = No Observable Adverse Effect Level; NSF = No Significant Findings; TI = Therapeutic Index – relationship of toxic dose to the projected human dose (calculation based on maximum daily dose of 500 mg and body weight of 70 kg); ALT = alanine aminotransferase; ALP = alkaline phosphatase; AST = aspartate aminotransferase; A/G = albumin/globulin; fc = food consumption; wc = water consumption; bw = body weight; RBC = red blood cells; WBC = white blood cells; retic = reticulocyte; PMN = neutrophil; M:E = myeloid:erythroid; K<sup>+</sup> = potassium; Cl<sup>-</sup> = chloride; P = phosphorus; Fe = iron.

## Carcinogenicity

Levofloxacin exhibited no carcinogenic or tumorigenic potential after dietary administration of 10, 30 or 100 mg/kg/day for 2 years in a rat carcinogenicity study. The highest dose was 1.4 or 6.7 times the highest recommended human dose (750 mg) based on surface area or body weight, respectively. The mean levofloxacin plasma concentration in the 2-year rat bioassay (at 100 mg/kg/day) was 34% of the human steady-state concentration after 500 mg b.i.d. dosing. In a 2-stage multiple organ carcinogenesis model in rats, levofloxacin at a dosage level of approximately 668 mg/kg/day in diet for 16 weeks did not promote the development of preneoplastic or neoplastic lesions after pretreatment with a number of wide spectrum carcinogens.

## Mutagenicity

Levofloxacin was not mutagenic in the following assays: Ames bacterial mutation assays (S. *typhimurium* and *E. coli*), CHO/HGPRT forward mutation assay, mouse micronucleus test, mouse dominant lethal test, rat unscheduled DNA synthesis and the mouse sister chromatid exchange (SCE) assays. It was positive in the *in vitro* chromosomal aberration (CHL cell line) and SCE assays (CHL/IU cell line).

<sup>&</sup>lt;sup>a</sup> In both studies, males (8 weeks old) were administered levofloxacin daily for 9 weeks prior to mating, throughout the mating period, and until necropsy. The females (11-12 weeks old) were treated daily for 2 weeks prior to mating, throughout the mating period, and for 7 days after copulation.

<sup>&</sup>lt;sup>a</sup> In both rat studies, the rats were dosed from Day 7 to Day 17 of gestation.

Table 2.53 - Segment III: Perinatal and Postnatal

Study	Maternal Toxicity	Embryo/Fetal Toxicity	Parturition/Neonatal Growth and Survival
Oral gavage, rat 0, 10, 60, 360 mg/kg/day 24 \(\times\)/group Dosed daily from Day 17 of gestation to Day 21 of lactation	salivation, diarrhea and soft feces at 360 mg/kg, salivation in some at 60 mg/kg, ↓ fc at 60 mg/kg during gestation and lactation (Days 14-18), ↓ fc during gestation ↑ fc during lactation at 360 mg/kg, ↓ wc on 2 days during gestation and ↑ wc during lactation at 360 mg/kg.  NOAEL = 10 mg/kg for dams.	No effects on either F <sub>1</sub> or F <sub>2</sub> generation.  NOAEL = 360 mg/kg for pups.	No effects

NOAEL = No Observable Adverse Effect Level

## **Special Studies**

# **Arthropathic Potential**

Levofloxacin and other quinolones have been shown to cause arthropathy in immature animals of most species tested (see WARNINGS AND PRECAUTIONS). In juvenile rats, 7 days of oral administration of 300 mg/kg/day levofloxacin results in blister and cavity formation in articular cartilage. In juvenile dogs (4 months old), 7 days of oral administration of 10 mg/kg/day levofloxacin produces blister formation, cavitation, and increased synovial fluid of diarthroidal joints. In young immature dogs (13 months old), blister formation and cavitation of the arthritic joint were observed in 1/3 dogs following oral administration of 40 mg/kg/day levofloxacin for 7 days.

In long-term multidose studies, arthropathy in rats was observed after oral administration of 800 mg/kg/day for 4 weeks, after intravenous administration at 60 mg/kg/day for 4 weeks and 90 mg/kg/day for 13 weeks. Arthropathic lesions were observed in 4-month-old dogs following 4 mg/kg/day intravenous administration for 2 weeks and in 7 to 8 month-old dogs following 10 mg/kg/day intravenous administration for 4 weeks. No arthropathy was observed following 2-week intravenous dosing at dosages up to 30 mg/kg/day in young adult dogs (18 months old). Three-month old beagle dogs dosed orally with up to 40 mg/kg/day levofloxacin for 8 or 9 consecutive days, with an 18-week recovery period, exhibited musculoskeletal clinical signs by the final dose at dose levels ≥2.5 mg/kg (approximately 0.2-fold the pediatric dose based upon AUC comparisons). Synovitis and articular cartilage lesions were observed at the 10 and 40 mg/kg dose levels (equivalent to and 3-fold greater than the potential therapeutic dose, respectively). All musculoskeletal clinical signs were resolved by week 5 of recovery; synovitis was resolved by the end of the 18-week recovery period; whereas, articular cartilage erosions and chondropathy persisted.

# **Phototoxicity**

When tested in a mouse ear swelling bioassay, levofloxacin exhibited phototoxicity similar in magnitude to ofloxacin but less phototoxicity than some of the other quinolones tested. A single

oral administration of 800 mg/kg levofloxacin followed by UVA exposure has been shown to result in ear erythema and swelling.

## Crystalluria

When tested in rats with 20, 60, 120 or 180 mg/kg of levofloxacin, crystalluria has been observed in some intravenous rat studies; urinary crystals are not formed in the bladder, being present only after micturition and are not associated with nephrotoxicity.

### **Cardiac Effects**

Levofloxacin exhibits a weak interaction with the human HERG channel. The  $IC_{50}$  for levofloxacin in inhibiting human HERG K<sup>+</sup> channel is 915 mcM. At therapeutic doses of 250, 500, and 750 mg levofloxacin, the peak unbound plasma concentrations ranged from 6 mcM for a single oral levofloxacin dose of 250 mg to 12 mcM and 15 mcM for 500 and 750 mg levofloxacin doses, respectively.

Studies in rabbit Purkinje fibers and studies in guinea pig right ventricular myocardium revealed no detectable effect on action potential duration with levofloxacin at concentrations up to 100 mcM.

The potential for levofloxacin to induce torsades de pointes was examined in a canine model of chronic high-degree atrioventricular block. Oral administration of levofloxacin at 6 and 60 mg/kg induced no ventricular arrhythmias. Monophasic action potential duration (MAP<sub>90</sub>) was not significantly affected by levofloxacin 0.3 and 3.0 mg/kg IV.

#### READ THIS FOR SAFE AND EFFECTIVE USE OF YOUR MEDICINE

#### PATIENT MEDICATION INFORMATION

PrAPO-LEVOFLOXACIN (Levofloxacin Tablets) Apotex Standard

Read this carefully before you start taking APO-LEVOFLOXACIN and each time you get a refill. This leaflet is a summary and will not tell you everything about this drug. Talk to your healthcare professional about your medical condition and treatment and ask if there is any new information about APO-LEVOFLOXACIN.

## **Serious Warnings and Precautions**

Talk to your doctor, if you:

- Have serious allergic reaction to levofloxacin or similar antibiotics such as ciprofloxacin, moxifloxacin, and others
- Have seizures (convulsions). Tell your doctor if you have any problems in the brain, including epilepsy. Your doctor will tell you whether you should use this medication.
- Have muscle problems (e.g. weakness, joint problems). **Do not use** levofloxacin if **you have or have had** myasthenia gravis.
- Have previous history of inflamed tendon (fiber that connects bones to muscles in the body) and tendon rupture. Your risk for tendon problem is greater, if you are over 60 years of age, and if you are taking steroid medication, or if you have had kidney, heart or lung transplant.
- Have family history of long QT syndrome (Prolongation of the heartbeat on an electrocardiogram test).

### What is APO-LEVOFLOXACIN used for?

APO-LEVOFLOXACIN is used to treat bacterial infections in the:

- Skin.
- Kidneys.
- Urinary tract (bladder or prostate).
- Sinuses.
- Lungs.

### How does APO-LEVOFLOXACIN work?

APO-LEVOFLOXACIN is in a group of antibiotics called quinolones (kwin-o-lones) that:

- Stop growth of bacteria.
- Kill the bacteria.
- Reduce the infection.

Some infections are caused by viruses, such as the common cold. APO-LEVOFLOXACIN does not kill viruses.

### What are the ingredients in APO-LEVOFLOXACIN?

Medicinal ingredients: levofloxacin (levofloxacin hemihydrate)

Non-medicinal ingredients:

### **Tablets**

250 mg: croscarmellose sodium, magnesium stearate, colloidal silicon dioxide, methylcellulose, stearic acid, hydroxypropyl methylcellulose, hydroxypropyl cellulose, polyethylene glycol, titanium dioxide, red ferric oxide.

500 mg: croscarmellose sodium, magnesium stearate, colloidal silicon dioxide, methylcellulose, stearic acid, hydroxypropyl methylcellulose, hydroxypropyl cellulose, polyethylene glycol, titanium dioxide, red ferric oxide, yellow ferric oxide.

750 mg: croscarmellose sodium, magnesium stearate, colloidal silicon dioxide, methylcellulose, stearic acid, hydroxypropyl methylcellulose, hydroxypropyl cellulose, polyethylene glycol, titanium dioxide.

### APO-LEVOFLOXACIN comes in the following dosage forms:

#### **Tablets**

APO-LEVOFLOXACIN 250 mg tablets are supplied as terra cotta pink tablets APO-LEVOFLOXACIN 500 mg tablets are supplied as peach coloured tablets APO-LEVOFLOXACIN 750 mg tablets are supplied as white to off white tablets

### Do not use APO-LEVOFLOXACIN if:

- You have allergic reaction to this drug or to other quinolone antibiotics (such as ciprofloxacin, moxifloxacin).
- You have a history of tendinitis (inflammation of tendon or tendon rupture). This condition causes pain and tenderness just outside of joint in shoulders, elbows, wrists, knees, heels, etc.

To help avoid side effects and ensure proper use, talk to your healthcare professional before you take APO-LEVOFLOXACIN. Talk about any health conditions or problems you may have, including if you:

- have kidney problems.
- have epilepsy.
- have or have had a seizures (convulsions).
- have had any problems with your heart rhythm, heart rate, or problems with low potassium.
- have a diabetes and are taking anti-diabetic medication (it may interfere with blood sugar levels).
- have a disease that causes muscle weakness (myasthenia gravis).
- experience any symptoms of muscle weakness, including breathing difficulties (e.g., shortness of breath).
- have a history of tendon problems associated with antibiotics.
- are pregnant or plan to become pregnant.
- are breastfeeding or plan to breastfeed. Talk to your doctor about how to feed your baby while you are taking APO-LEVOFLOXACIN.

# Other warnings you should know about:

Changes in Blood Sugar:

If you have diabetes, you may develop a hypoglycemic reaction (low blood sugar) with common symptoms such as:

- Dizziness.
- Excessive hunger.
- Lack of coordination.
- Headache.
- Fatigue.
- Fainting.

or a **hyperglycemic reaction** (high blood sugar) with common symptoms such as:

- Excessive thirst.
- Excessive urination.

### You should call your doctor if you experience any of these symptoms.

### Allergic Reaction:

If you develop one of the following:

- -Hives.
- -Itching.
- -Skin rash.
- -Difficulty breathing or swallowing.
- -Swelling in the face, tongue or throat.
- -Other symptoms of an allergic reaction.

### you should stop taking this medication and call your doctor.

### Operating Heavy Machinery:

You should know that use of APO-LEVOFLOXACIN may cause dizziness. Please make sure that you know how to react if you are:

- -driving a car.
- -operate any machinery at working place.
- -perform work that needs mental alertness or coordination.

### Exposure to Sunlight:

You should not expose yourself to sunlight or artificial ultraviolet light while you are taking APO-LEVOFLOXACIN. Use sunscreen and wear protective clothing if out in the sun.

Tell your healthcare professional about all the medicines you take, including any drugs, vitamins, minerals, natural supplements or alternative medicines.

## The following may interact with APO-LEVOFLOXACIN:

- antacids, multi-vitamins, or products containing metals (such as aluminum, calcium, iron, magnesium or zinc).
   See How to take APO-LEVOFLOXACIN.
- medicines used for ulcers (such as sucralfate). See How to take APO-LEVOFLOXACIN.
- medicines used for heartburn or gout (such as probenecid, cimetidine, etc).
- medicines used for treatment of asthma or chronic obstructive pulmonary disease (COPD) (such as theophylline).
- medications for arthritis (nonsteroidal anti-inflammatory drugs (NSAIDs) such as ibuprofen, naproxen).
- blood sugar medicines (such as metformin, gliclazide, insulin,etc).
- medicines used for any heart conditions.
- blood thinner medications (such as warfarin, etc.) that used to thin the blood and prevent clots may predispose you to the development of bleeding problems.

This medication may interfere with certain laboratory tests (such as urine screening for opiates), possibly causing false test results.

### How to take APO-LEVOFLOXACIN:

You should swallow the whole tablet with or without food.

Try to take the tablet at the same time and drink plenty of fluids while taking this medicine unless otherwise directed by your doctor.

Do not share your medicine with anyone.

Antibacterial drugs like *APO-LEVOFLOXACIN* treat only bacterial infections. They do not treat viral infections. Although you may feel better early in the treatment, APO-LEVOFLOXACIN should be used exactly as directed.

Misuse or overuse of APO-LEVOFLOXACIN could lead to the growth of bacterial that will not be killed by APO-LEVOFLOXACIN (resistance). This means that APO-LEVOFLOXACIN may not work in the future.

Ask your pharmacist about the other products you take. Some medicines will affect the way that your body absorbs APO-LEVOFLOXACIN. Take APO-LEVOFLOXACIN at least 2 hours before or 2 hours after taking these medicines. Some examples include: vitamins/minerals (including iron and zinc supplements), and products containing magnesium, aluminum, or calcium (such as antacids, calcium supplements).

### Usual adult dose:

You should take this medication by mouth as directed by your doctor.

The dosage and length of the treatment depends on your kidney function, medical condition, and response to treatment. It may last for 3, 5, 7, 10, 14 or 28 days depending on your condition.

Tell your doctor if your condition does not improve.

#### Overdose:

If you think you have taken too much APO-LEVOFLOXACIN, contact your healthcare professional, hospital emergency department or regional poison control centre immediately, even if there are no symptoms.

Symptoms of overdose may include: severe dizziness.

#### **Missed Dose:**

If you miss a dose, take it as soon as you remember. If it is near the time of the next dose, skip the missed dose and resume your usual dosing schedule. Do not double the dose to catch up.

### **Reporting Side Effects**

You can report any suspected side effects associated with the use of health products to Health Canada by:

- Visiting the Web page on Adverse Reaction Reporting (<a href="https://www.canada.ca/en/health-canada/services/drugs-health-products/medeffect-canada/adverse-reaction-reporting.html">https://www.canada.ca/en/health-canada/services/drugs-health-products/medeffect-canada/adverse-reaction-reporting.html</a>) for information on how to report online, by mail or by fax; or
- Calling toll-free at 1-866-234-2345.

NOTE: Contact your health professional if you need information about how to manage your side effects. The Canada Vigilance Program does not provide medical advice.

### Storage:

Store at room temperature (15°C to 30°C) in well-closed containers and protect from light. Keep out of reach and sight of children.

Do not use after the expiry date. Generally, all expired medications should be returned to your pharmacist.

## If you want more information about APO-LEVOFLOXACIN:

- Talk to your healthcare professional
- Find the full product monograph that is prepared for healthcare professionals and includes this patient medication information by visiting the Health Canada website (<a href="https://health-products.canada.ca/dpd-bdpp/index-eng.jsp">https://health-products.canada.ca/dpd-bdpp/index-eng.jsp</a>); the manufacturer's website <a href="http://www.apotex.ca/products">http://www.apotex.ca/products</a>, or by calling 1-800-667-4708.
